The preceding article "Looking for information" is flame-bait. Maybe I am thinking wishfully, but it would be nice if we could keep responses in e-mail rather than watching another silly flame war erupt over nothing. Thanks...

Stephen

2. Re: Ramsey kits not too good?

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-01 02:48:35 UTC
From: duncan@ravel.ati.com
Message-ID: <192@ravel.ati.com>
Source record: 272698

In article <2fvl4d$1ul@chippewa.pd.tgi.plexus.com> markh@news.plexus.com (Mark Heimmermann) writes:
>Along this same lines, I was wondering what does the ham
>community think about Hamtronics Kits. We are considering
>them to build a repeater here.
>
My ham friends (Motorola addicts) think these are also junk. Indeed the UHF receiver strip I bought from Hamtronics was overpriced and was just a so-so performer. Hamtronics kits are much better than the Ramsey products, however.

3. Finally got my license in the mail!

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-01 04:13:36 UTC
From: SUSEEA@MAINE.MAINE.EDU
Message-ID: <93365.231336SUSEEA@MAINE.MAINE.EDU>
Source record: 272699

Took the Tech test and 5wpm code on OCT. 20, 1993 and recieved
the license on Dec. 24, 1993. Nice Christmas present I thought.
Just thought some of you out there would like to know the waiting
time.
Alan
N1QWT

*** My son, 11 years old also passed his Tech with 5 wpm code. He
recieved his ticket the same day as me. N1QWV

Now there are 3 generations of HAMS in this family.

4. Daily Summary of Solar Geophysical Activity for 31 December

DAILY SUMMARY OF SOLAR GEOPHYSICAL ACTIVITY

31 DECEMBER, 1993

/\

(Based In-Part On SESC Observational Data)

** Best Wishes for a Happy and Pleasant 1994 **

SOLAR AND GEOPHYSICAL ACTIVITY INDICES FOR 31 DECEMBER, 1993

NOTE: Intense stratospheric warming is continuing over central and
northeastern Siberia, Alaska, and Northwestern Canada and the
Siberian and Canadian Arctic. Warming is spreading north and
northeastwards. Temperature gradient is reversed between 60N
and the pole at 10 HPA and upwards in the upper stratosphere.

NOTE: The Effective Sunspot Number for 30 DEC 93 was 63.8.
The Full Kp Indices for 30 DEC 93 are: 1+ 0+ 2- 2- 2- 1+ 1- 0o

SYNOPSIS OF ACTIVITY

Solar activity was low. Intermittent C-class activity was
the order of the day, with the brunt of the flares originating
in or near the Region 7640 (N08W80) complex. Reports
characterize this area as being largely stable. Region 7645

(N11E43) in the opposite hemisphere had only a few small flares, but remains complex magnetically. One new region was born on the disk, 7647 (S15E34).

Solar activity forecast: solar activity is expected to be low to moderate. Regions 7640 and 7645 hold the best promise of an isolated M-class event.

The geomagnetic field was quiet early in the period, then experienced minor to major storm conditions at the midway point. This disturbance, thought to be related to a western hemisphere coronal hole, now seems to be weakening.

Geophysical activity forecast: the geomagnetic field is expected to be predominantly unsettled, with episodes of active conditions likely during local nighttimes.

Event probabilities 01 jan-03 jan

Class M 50/50/50
Class X 05/05/05
Proton 05/05/05
PCAF Green

Geomagnetic activity probabilities 01 jan-03 jan

A. Middle Latitudes
Active 25/15/20
Minor Storm 25/05/10
Major-Severe Storm 05/01/01

B. High Latitudes
Active 30/15/15
Minor Storm 30/05/25
Major-Severe Storm 15/01/01

HF propagation conditions were near-normal over the low and middle latitudes. Conditions were more unstable for the higher latitude paths due to periods of increased geomagnetic and auroral activity. Occasionally poor propagation conditions existed over the night-sector high latitude paths, particularly on transauroral circuits. Similar, if not improving, conditions are expected over the next 72 hours. Near-normal propagation should return to all regions by 02 or 03 January.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,

Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

The N8EMR Ham bbs is online to serve the needs of the
amateur radio operators..

HOW TO ACCESS THE N8EMR HAM RADIO TELEPHONE BBS !!!

System Name: N8EMR
Phone: 614-895-2553
Login: hbbs
Modems: TB2500 PEP/V.32 support
Times: 24hrs
IP Address: 44.70.0.1
Amateur radio annonymous ftp access is available via the ohio
netrom/ip network. CMHIP is the Netrom node Id and is known
by most of the nodes in ohio. (its slow but it works)
This is only via the ohio packet network. This sytem
is not available via the "INTERNET".

To access the system via the dialup, at the login prompt type hbbs
(lower case only), you will then enter the BBS program. Follow the
directions from the bbs prompts.

I attempt to keep the latest and greatest HAM software on-line, and
encourage all to upload Here is some of software that is available
for downloading.

NEWHAM area. Pick the tools you need to become a ham
AMSAT news and satellite keplerian elements
KA9Q TCP/IP Software for various computers,
ARRL related files
Latest packet bbs programs and utilitys.
Modifications for HAM Rigs and Scanners
DX and contesting programs
Many Packet related programs
Scanner, shortwave and TVRO files and messages.
NASA NEWS..
Online Callsign lookup.

Question or comments to

EMAIL CALLSIGN SERVER
US CALLS ONLY
(access interface changed..)

For those who do not have telnet access to marvin or one of the other
Internet callsign servers here is an alternative.

N8EMR's Ham BBS, 614-895-2553 has an email server up and running.
The Server is based on Buckmasters Fall 92 database.

------------------------ INTERNET AND CIS USERS -----------------------------

Mail should be addressed to
callbook@n8emr.cmhnet.org

You MUST use the reply line now.. To many people with bad
reply paths.. I got tired of seeing the errors bounced back to me.

There are two command line options. One is REPLY. This command
is used to specify the return path to use for the callbook request.
You can use internet @ or bang ! path format.

The second command is CALL. This command is used to specify a list of
callsigns. Each call sign is seperated by a white space. All other
lines and info are ignored.

E.G.
# mail callbook@n8emr.cmhnet.org
REPLY user@site.domain (your reply path, ! or @ format.)
CALL n8emr w5rrr (list of calls, space seperated)
^D
#

------------------------- PACKET RADIO ----------------------------------------

Mail should be sent to CBOOK@N8JYV.#CMH.OH.USA.NA
You MUST use both the REPLY and CALL option lines.
The REPLY line should be as follows n8jyv!HOME_BBS!CALL, where
HOME_BBS is your local packet bbs where you would normal pick up
your mail, CALL is your callsign.
You must include the n8jyv! in your reply path.. Packet mail will fail
without this.

E.g.
SP CBOOK@N8JYV.#CMH.OH.USA.NA
Subject ^M
REPLY n8jyv!w8cqk!n8emr
```

```
CALL n8emr w1aw
/EX
```

7. Re: RFI into telephones

>JU>often be cured by placing 250 Volt 100nF or 10nF capacitors between
>JU>Tip and Ring. Tip and Ring is the name for the two wires that carry
>JU>the phone signal.
>
> Any particular reason why 250V?

That is the standard for such applications in the telephone industry. Why 250V and not say 90V? Well, first of all, telephone equipment is designed to withstand massive surges - 1,000V at 1,000A is a Bell System surge test. This is to withstand the sort of crud that is liable to be found on a phone line. These sort of surges can occur from power lines falling on telco lines and with induction from lightning strikes. Then the standard ringing voltage is between 40 and 150 Volts AC (Usually 20Hz). Don't forget the capacitor voltage rating is DC. A 250V capacitor will tend to survive these lab tests and survive in the field too. Often equipment is sold that is not built ruggedly enough - capacitors and semiconductors that work on a perfect line will fail any stormy day in Kansas.

In most telephone equipment, Polyester film (It's not just for leisure suits anymore) capicitors seem to be the best. If subjected to overvoltage, they will often "flash-over" and puncture the film but will not short or open after the event. The best polyester film capacitors for telco use are Rifa capacitors made by L. M. Ericsson.

For documents on signals and voltages telephones are subjected to see FCC Part 68 and Bell Pub 48005.

Archive-name: radio/ham-radio/elmers/admin
Revision: 1.6 12/26/93 15:45:09
Changes: Added new index file, Gopher, WWW, and WAIS entries

This administrivia file and the companion Amateur Radio Elmers Resource
Directory are intended for non-commercial distribution via Usenet. Any
other uses, please E-mail for permission.

A Brief Historical Overview:
++++++++++++++++++++++++++

If there is any one constant in the changing state of the communications
art, it is that "Hams" (Amateur Radio Operators) have always been on
the forefront of it. Rumors abound where the term "Ham" came from.
Some of the more amusing are described at the end of this article.

Regardless of origin of the name, a "Ham" is universally recognizable as
one who experiments in radio and communications.

Whether it be constructing a low-power CW radio with vacuum tubes, or
designing TCP/IP packet networks, such experimentation has historically
spilled over into the mainstream such as was the case with Edwin
Armstrong, who developed the regenerative oscillator and FM radio, or
General Curtis LeMay (W6EZV) who was instrumental in making Single-
Sideband the communications standard for the Strategic Air Command
(1947-1992, now reorganized into a joint command called USSTRATCOM) and
eventually the U.S. Air Force. Although packet-switching techniques
originated from DARPA (Defense Advanced Research Projects Agency) and
the ARPANet, no one can deny the tremendous influence that amateurs
have had in demonstrating the viability of TCP/IP and AX.25
communications via radio links. The efforts of AMSAT (the Amateur
Satellite Corporation), including the development of many ham satellites
and the low-orbiting Microsats (communications satellites no bigger than
a breadbox that use store-and forward packet techniques), have certainly
advanced the state-of-the-art in communications, one of the defined
purposes of the Amateur Radio Service, as recognized by international
treaty.

Since in many cases hams are writing "the book", there is often no
"book" or other established reference for a beginner to refer to.
Traditionally, information has been passed on from ham to ham via word-
of-mouth. Like many of the traditional crafts, a variation of the
Master-Apprentice system has emerged, the Elmer-Novice relationship.
Called "Elmers" because they are usually older and wiser, having the
```

benefit of many years in the hobby, including several failed projects, and an electric shock or two, they have traditionally been the mainstay of amateur radio, and the source of many new hams, particularly those interested in working on emerging technologies.

Even more importantly, Elmers provided an outlet for the impatient newcomer who wanted "to know everything, and right away." Faced with such a request, a good Elmer will smile and proceed to lead the novice through some project or operating experience. Several hours, days, or weeks later, the novice would have his answers, but would have earned them. Even better, the sense of accomplishment would boost the novice's confidence and nudge him or her down the road to being a model, experienced ham operator.

Many present hams feel that such an experience is missing today. In today's hustle-bustle world, the response to such natural curiosity and desire to learn is, more often than not, "I'm too busy" or "RTFM." As a result, the quality of new hams declines and the knowledge and operating habits they develop in their first formative months and years leave much to be desired. And the very same hams who claim that they "can't understand the new generation" also, in almost the same breath, lament about the "decline of amateur radio."

What is an Elmer today?
++++++++++++++++++++++

An Elmer today is of any age, male or female, who has some expertise and is willing to share it with beginners. Elmers don't even need to be licensed amateurs, just people with knowledge in some area of electronics or communications technology.

What is a Usenet Elmer?
++++++++++++++++++++++

With the ever-widening scope of the Internet, and the amateur radio newsgroups on Usenet, the potential for Elmers to share their knowledge to a wide audience has never been greater. To that end, I have started to maintain a list of such Elmers. Volunteers need only send me their name, E-mail address, and area of expertise. I have set up an administrivia mailbox for this purpose (elmers-request@unomaha.edu, the default Reply-To: of this message).

Those desiring a more extensive list, or who need more specific assistance, are encouraged to contact Rosalie White, WA1STO, Educational Services Manager at the American Radio Relay League, 225 Main St., Newington, CT 06111 or via electronic mail addressed to rwhite@arrl.org.

How may I obtain the latest copy of the Elmers List?
++

There are currently 7 ways of obtaining the Elmers List. Any site at least reachable by Internet E-mail can use options 3 or 4:

1. Usenet News: The latest copy of the list can be found in the companion posting to this message, "Amateur Radio: Elmers Resource Directory." Since the list is cross-posted to rec.radio.amateur.misc, rec.radio.info, rec.answers, and news.answers on the 1st of each month, with an expiration date 6 weeks into the future, there should always be a copy available at most news sites. Check your newsreader documentation for information about reading previously-read articles.

2. Anonymous FTP: If your site is directly connected to the Internet, you may retrieve the latest copy via File Transfer Protocol (FTP) from the following sites:

ftp.cs.buffalo.edu /pub/ham-radio/elmers*
rtfm.mit.edu /pub/usenet/news.answers/radio/ham-radio/elmers/*

3. Mailing-List: Since the list is cross-posted to rec.radio.info, the latest copy may be obtained from the mailing-list gateway for that newsgroup (along with many other informational articles about radio) when it is published each month. To subscribe, send E-mail to:

listserv@ucsd.edu

and in the BODY (not the Subject) of the message, write:

subscribe radio-info

The server may not be able to determine your return address. In that case write:

subscribe radio-info (your E-mail address)

You should get an acknowledgement very shortly.

4. Mail-Server: If you don't want to read through the entire gateway of rec.radio.info, or want a copy of the list right away, send E-mail to:

mail-server@rtfm.mit.edu

and in the BODY (not the Subject) of the message, write:

send usenet/news.answers/radio/ham-radio/elmers/admin
send usenet/news.answers/radio/ham-radio/elmers/index
send usenet/news.answers/radio/ham-radio/elmers/list
send usenet/news.answers/radio/ham-radio/elmers/diff

and the latest copy of the list should be sent to you E-mail within 24 hours (the mail-server uses batch priority to reduce system demand).

The last three services are experimental. I'm not terribly familiar with them, and cannot offer much technical support regarding their use. (I'd appreciate feedback on whether or not you find them useful, though.)

5. Internet Gopher: The latest copy of the list should be available from the following Gopher sites, all at standard port 70:

cc1.kuleuven.ac.be
jupiter.sun.csd.unb.ca
gopher.univ-lyon1.fr
ftp.win.tue.nl
gopher.win.tue.nl

see also comp.infosystems.gopher

6. World-Wide Web (WWW): The latest copy of the list should be available from the following WWW site:

URL: http://www.cis.ohio-state.edu:80/hypertext/faq/usenet

under pages:

radio/ham-radio/elmers/admin
radio/ham-radio/elmers/index
radio/ham-radio/elmers/list
radio/ham-radio/elmers/diff

see also comp.infosystems.www

7. Wide-Area Information Service (WAIS): The latest copy of the list should be available from the WAIS server at rtfm.mit.edu (standard port 210) in database "usenet."

see also comp.infosystems.wais

How may I contribute to the Elmers List?
++++++++++++++++++++++++++++++++++++++

By using this resource, you are benefitting the net by obtaining assistance in the fastest and most efficient way possible. By volunteering to appear on this list, you are contributing to the good reputation of the radio-related newsgroups.

Thanks to all the volunteer Elmers, as well as courteous list users, for making this service a success.

--
73, Paul W. Schleck, KD3FU

pschleck@unomaha.edu (personal mail)
elmers-request@unomaha.edu (Elmers List administrivia)

* Possible origins of the word HAM:

The acronym "Home Amateur Mechanic" or...

from the Cockney pronunciation of "L'amateur" or...

the initials of the founder of the American Radio Relay League, Hiram Maxim, W1AW (his actual middle name being Percy apparently notwithstanding) or...

from the call letters of one of the first amateur stations at Harvard, H.A.M. (please, no flames from W1XM at MIT)

Dale Mosby, N7PEX, offers the explanation that HAM must stand for "Hardly Any Money," considering the investment one could make in the hobby.

Knowledgeable individuals from the American Radio Relay League (ARRL), and other radio historians, seem to agree that the terms "Ham" and "Lid" (an inept operator) both originated with landline telegraphy. A "Ham" was a show-off and a "Lid" was a telegraph operator so inexperienced, he had to use a pot or can lid to rest his telegraph sounder on to properly copy the code.

As an interesting historical footnote, early telegraph operators may have been the first to experience the infamous curse of our communications age, Repetitive Stress (or "Carpal Tunnel") Syndrome (called "Glass Arm" in those days, which encouraged the invention of the semi-automatic or "bug" key).

(Larry E. McDonald, N6ZMB, wrote to point out another plausible origin, which doesn't necessarily contradict the ARRL version. The term "ham" may have been derived from "ham-fisted" or "ham-handed" to describe poor telegraph operators who were hired from the ranks of radio operators. Or maybe "ham-fisted" and "ham-handed" are derived from "ham." Who knows?)

Amateur Radio Elmers Resource Directory (as of 01/01/94)
++++++++++++++++++++++++++++++++++++++++++++++++++++++++

David Andrews ZL2SX

andrews@kai.ee.cit.ac.nz

I have been involved with the Amateur Radio International Travel Host
scheme. I also chair the NZART Frequency Management and Technical
Advisory Group, which is responsible for all repeater coordination and
band-planning (LF, MF, HF, VHF, UHF, and above) in New Zealand. I would
be pleased to answer any queries with regard to reciprocal licensing or
frequency coordination that may arise.

++++++++++++++++++++++++++++++++++++++++++++++++++++++++

Jeff Angus WA6FWI

jangus@skyld.tele.com

I run NOS as a tcp/ip <--> AX.25 mail bbs gateway. I also run a few nodes,
soon to replace with Tnet-x1g on one and a PC NOS-switch on the other.
And, I have successfully installed UUPC/extended 1.11k and SNEWS for those
MS-DOS afficionados out there.

ampr.org IP Coordinator for California - Los Angeles and San Fernando
Valley subnet (44.016.xxx.xxx)

"We're here to help, we don't loan tools" (Just kidding....put me on the
list). Monday-Thursday 8 AM to 9 PM Pacific time, Friday 8 am to 5 pm.

1976-1978 FCC Personal Users Radio Advisory Committee
Task force for rules Rewrite Citizens Radio Service
Rules Interpretation

1988-Present Stratus Computer/ Technical Support Engineer

I am CEO of Creative Media Productions a multimedia consulting
company.

Address: Jay_Appell@cac.stratus.com
Telephone: 1-508-478-6969 X200 at Creative Media Productions
1-508-478-1429 24 Hour Ham radio BBS and other topics

I enjoy SCA reception and multimedia use in Amateur Radio. If anyone would
like to reach me by modem, 508-478-1429 (24 Hr) BBS 14,400.

I have been referred to as the ham responsible for digital users manuals
in amateur radio. The first manual was the DJ-590 and subsequent manuals
included the 560,580 and 600 for Alinco. My contacts in the amateur radio
community have helped other amateurs to know more about products, hidden
features and new product offerings. The BBS will now included the latest
info on YEASU and ALINCO products. If you have a product that you wish to
have evaluated for the general amateur community, please contact before
sending.

If you have questions with regard to customer service at these
companies, please forward to me and they will be passed to the company
contacts.

Author of the following MS-DOS ham programs:

AutoExam - Examination simulator and study aid
AutoCW - Morse Code practice program
DOSGATE - allows users to run programs on your PC remotely (AutoExam
compatible)
AutoCall - Allows use of the Buckmaster HAMCALL CD-ROM online callbook

with DOSGATE
AutoFax - Allows reception of weather fax using Kantronics TNC's
SeeSats - Real time satellite tracking (text only), DOSGATE compatible

Most of these programs are available from wuarchive.wustl.edu under
/mirrors/msdos/hamradio or write me at:

7 Red Field Circle
Derry, NH 03038

and enclose:

A FORMATTED high density diskette (either 1.44 MB or 1.2 MB; 3.5" or 5.25").
A Self Addressed STAMPED return diskette mailer.
A note explaining that you want a copy of AutoExam and/or AutoCW
(or one of the other programs).

I am always receptive to individuals interested in maintenance,
enhancements, and non-commercial distribution for these shareware
programs.

I can assist anyone with most PC installation/troubleshooting problems. I have a good deal of experience installing and configuring OS/2, have a good grasp of Unix (not a wizard yet though :), and a thorough familiarity with the ISA bus and the cards that go in it.

On the radio side of things, I like digital modes and experimenting with antennas, specifically:

- PACTOR and AMTOR
- Configuring Kantronics All-Mode (KAM) TNC's for proper operation
- Over a decade of packet experience, including setting up both DOS and OS/2 versions of KA9Q NOS
- HF wire antennas, including 160m full-wave delta loops

Radio Frequency Interference (RFI) matters
Equipment Testing

I want stories about automotive EMI problems, dealings with dealers,
and, if possible, solutions. I plan to forward these to my contact at
the Society of Automotive Engineers (SAE).

If anyone knows the *right* people at any particular company, I want
to know. I am also pursuing (via the SAE) more official channels.

EMI/RFI Resource List and RFI Tips package available. A business
SASE with 98 cents postage is appreciated. Electronic versions
available soon. Please specify the desired documents in your
correspondence.

Many amateur radio informational documents (including EMI/RFI files) are
also available from the ARRL info server. Send E-mail to info@arrl.org
with the word "HELP" in the message body.

Steven M. Knapp KA9QOA Computer Engineering Senior
sknapp@iastate.edu Vice President Cyclone Amateur Radio Club
Iowa State University; Ames, IA Durham Center Operations Staff

A few members of our ham radio club were interested in helping out.
Since our turnover is usually 4 years or so (graduation is a horrible
thing), I thought it may be difficult for us to keep the list up to
date. I thought that by creating a local mailing list called
"elmers@iastate.edu" we could add or remove people as need be. There
would always be at least one person receiving mail on that list,
usually more! Even after I graduate, this list will be maintained
allowing ISU hams to easily help others.

Currently we have people with packet experience, some HF experience,
much repeater experience, in addition to a considerable background in
theory, as many here are electrical engineering or computer engineering
students. If a question can not be answered by the readers of the list,
there are many other local hams that could be prodded for the info.

Our local ham radio club has been especially interested in helping local
disabled hams (or hams to be) get on the air. But anyone local who
needed help would find a group at their door ready to work.

I can help people with HF stuff, cheap antennas, and am willing to help troubleshoot problems with rigs.

I believe that one of the pillars of ham radio - construction/ understanding at the burn-your-hand-with-a-soldering-iron level - is drifting out of ham radio. With Japanese radios which cost so much, fewer and fewer hams are willing to risk their warranty to service their own equipment. I would like to see a turn-around here...

David Stockton, GM4ZNX

dstock@hpqmola.sqf.hp.com

SWL since 1960
Licensed since 1984 (UK full class A)
Degrees in electronics&comms and digital techniques etc.
Currently senior design engineer doing RF design

Fairly broad interest in amateur radio (but not contests!)

Antennas, Transmission lines,filters from fundamental theory to practice
Receiver structures and circuits from simple to state of the art.
Transmitters, ATUs
Test equipment
Wide experience of troubleshooting/repairing equipment.
Professional experience of EMC/RFI
QRP
UK Operation and Licensing

My morse is flaky, but I keep working on it
No interest in contests
No interest in packet radio or in fixing computers

48 Johnson Road
Pasadena, Md. 21122
401-437-1758 (home)

kstuart@oasys.dt.navy.mil

via packet: W3VVN @ N3ETI.MD.USA

Have been licensed since '53, currently Advanced class. ARRL Technical Advisor since '80 on Batteries and Power Supplies. You may have seen my article in the Feb. '91 issue of QST on NiCads. Authored the rewrite of the power supply chapter of the ARRL handbook in '85 when the new format was generated (large page, versus the old small size). Most of the stuff is still unmodified. Currently lecturing on battery care and feeding to clubs in the Baltimore/Annapolis area.

I have been employed as a power supply design engineer for about the last 25 years.

+ Steven M. Knapp KA9QOA Computer Engineering Senior
+ sknapp@iastate.edu Vice President Cyclone Amateur Radio Club
+ Iowa State University; Ames, IA Durham Center Operations Staff
+
+ A few members of our ham radio club were interested in helping out.
+ Since our turnover is usually 4 years or so (graduation is a horrible
+ thing), I thought it may be difficult for us to keep the list up to
+ date. I thought that by creating a local mailing list called
+ "elmers@iastate.edu" we could add or remove people as need be. There
+ would always be at least one person receiving mail on that list,
+ usually more! Even after I graduate, this list will be maintained
+ allowing ISU hams to easily help others.

+
+ Currently we have people with packet experience, some HF experience,
+ much repeater experience, in addition to a considerable background in
+ theory, as many here are electrical engineering or computer engineering
+ students. If a question can not be answered by the readers of the list,
+ there are many other local hams that could be prodded for the info.
+
+ Our local ham radio club has been especially interested in helping local
+ disabled hams (or hams to be) get on the air. But anyone local who
+ needed help would find a group at their door ready to work.
+
+ ++
+
I'll be glad to help out with tube circuits and VE testing.
(W5YI VE# 3182)

In article <21870055@hplvec.LVLD.HP.COM> scott@hplvec.LVLD.HP.COM (Scott Turner) writes:

>How do I stay away from these things if I don't know where they are?
>Look, this hiding of links and such-like strikes me as being just a bit
>silly. If I really want to mess with a link, I'm going to figure out
>where it is and mess with it.

I don't think the intent is to "hide" the link data from the casual user, but
that it is not relevent to the intended market of the ARRL Repeater Directory.

>
>Most amateurs *want* to cooperate on the band, and will use more
>information to help them do so. I'm doing a lot more simplex these days,
>especially on 2 meters, and soon on 450, and the band plan listed in the
>ARRL repeater directory strikes me as inadequate to help guide me to
>open simplex frequencies.

Not to mention the fact that the ARRL "band plan" printed in the directory
is NOT USED in much of the country. Please join your local coordination
group and help them to make a reasonable band plan. That's what is really
needed.

Never-the-less in the context of the "repeater database" that was the subject
of this thread, Scott's call for such information to be published makes perfect
sense. I would hope the database would have uses the ARRL directory does not
try to address.

Happy New Year everyone...

No, Jeff, most hams don't go to libraries or read books.
Few of the public do either, whether hams or not.
I believe this is primarily because reading is too painful for them.

Judging by the quality of the English most hams write (just examine the
typical packet radio message), the written word has become a lost art.

That's probably why so many manufacturers are now offering instructions
on video - too many customers can't read the old-style instruction sheets.

Sad, isn't it?
- Brian

16. RACES Bulletin #307

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-01 19:54:52 UTC
From: enge@almaden.ibm.COM
Message-ID: <199401011955.LAA28514@ucsd.edu>
Source record: 272710

Bid : $RACESBUL.307

TO: ALL ES, CD, AND PUBLIC SAFETY DIRECTORS VIA AMATEUR RADIO
INFO: ALL RACES OPERATORS IN CALIFORNIA
INFO: ALL AMATEUR RADIO OPERATORS
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6SIG@WA6NWE.CA)
2800 MEADOWVIEW RD., SACRAMENTO, CA 95832 916-262-1600
LANDLINE BBS OPEN TO ALL 916-262-1657
RACESBUL.307 RELEASE DATE: January 3, 1994
SUBJECT: MGT - Observations - Part 3/3
The Radio officers said that their programs suceeded because:
1. It is clearly established that the county official is in
charge -- not an outside organization.
2. They train in and perform some duties other than two-way radio
because that is what is needed by and useful to the local government.
3. The radio officer is accepted as regular staff and attends
staff meetings, goes to the agency office regularly, and actively
seeks new and expanded ways in which the volunteers can serve the
agency and local government. In other words, the RACES (or by whatever
name) is not a declared disaster-only operation. Unfortunately, that
last interpretation of the RACES is still widely misunderstood and
propagated by those with a different agenda.
A few reported that their packet bulletin board did not carry the
RACES Bulletins and that the reason was unknown. I suggested they
contact their BBS sysop to work backward through the delivery system
to identify the drop out. The RACES Bulletins are by and for all
communications volunteers in government service --- and not just hams,
either.

Some disaster management officials with whom I spoke said they
have a fine RACES group but never heard of and saw the RACES
Bulletins. I pointed out that the RACES Bulletins are addressed to the
official and not the messenger (recipient station). If the official
claims to have a fine group but isn't getting the mail because it's
not being forwarded -- well, there seems to be a problem with the
messenger, does it not?
We solicit your comments, views, input, suggestions, ideas and
reports.
--- Stan Harter, CA State Office of Emergency Services
EOM

RACES Bulletins are archived on the Internet at ucsd.edu in hamradio/races
and can be retrieved using FTP.

In article <2g4blqINNs9j@network.ucsd.edu> brian@nothing.ucsd.edu (Brian Kantor) writes:
>No, Jeff, most hams don't go to libraries or read books.
>Few of the public do either, whether hams or not.

I once heard that 3% of the population had library cards. Then
I read the 5% of the public buys books.

I wonder what perecentage have VCRs and video rental cards.

I know that many homes I visit have few or no books. I am alos
stunned by the number of radio amateurs that do not have any manuals
or handbooks on their favourite hobby.

Could the lack of literacy be related to the falling numbers
involved in participatory activities?

>I SEEM TO RECALL A FLURRY OF INFO A FEW YEARS BACK ABOUT TOYOTAS AND MOBILE RIG>S. ANYONE OUT THERE RECALL THE BASIC SCOOP? TNX ES 73, BRIAN, WY2G

I bought a '92 Camry and about a month after installing a 50W 2m rig, I read that someone blew one of the car computers while running 100W on HF and was forced to pay for the $1000 computer because, buried in some service manual at the dealer somewhere, they state that you cannot run more than 10 W in the car. I asked my dealer about this and he agrees with this finding, but has no suggestions about where to route cables to minimize such problems... heck, he couldn't even tell me where the computers were exaclty. He said they were everywhere. I have been running 5W with no problems with an occasional bump up to 25 W. However, I usually turn the car off and park it before I crank it up to 50 W which is very rarely needed. So far, no problems! Knock on wood..

>You don't propose any thing different than already exists...in the paper
>edition. Lets make this a new and real product.

>I really don't care where the repeater is located...I want to know the
>geographic areas that I can reliably communicate either on my
>handy-scratchy or my 30 watt mobile. Sinse you are offering a graphic
>interface you could show coverage maps of repeaters overlaid on a good
>highway map.

Knowing where the repeater is can be valuble, because a standard 3
second topo data base is available that when given the lat/long of the
repeater and the antenna pattern info can predict the coverage. Note
that coverage can be different depending on the frequency involved - 6m
has very different coverage from 2m even from the same site and power.
Ditto 2m/220, 220/440, 440/1200. If the coverage maps were to be
developed from repeater locations, then a knowledgeble user could
simply plug in a new repeater himself, and not have to wait for a
vendor update. A method of copying the info from an existing repeater
at the same site would be a good interim method.

I have seen two differnt windows based highway map products. The one
that I can remember the name of is Del Orme, is CD based, and I think
is available from Egghead. I don't remember the other name.

> An interface to gps could enhance your product.

There is a standard 1200 baud interface for most GPS rx's that gives
latitude, longitude and time of day. Crosshairs and a clock in a corner
would be a nice feature. Esp. if it self adjusted for Daylight time and
time zone.

>How about a
>descripter file of the type of use , times of local nets and news broadcasts.

I'd like to see that - for example one wide area machine near me has a 30 second timer. Every local knows it, every visitor times it out. A text comment block for W6FNO could warn the visitors, and let them know about the Tues night 7pm roll call.

>Your listing of the 250 repeaters in the San Francisco Bay Area is
>meaningless if it just reflects what is in the ARRL Directory. Many of the
>local repeaters are listed as closed but are in fact quite open to the
>travelling amateur. Some repeaters are low level 25 mile coverage machines
>that can be quite popular. Other repeaters are high level 150 mile
>repeaters that have no usage at all. I have seen repeaters go from vary
>active to next to nothing in a matter of months. In essence we do not have
>the user base to support 250 repeaters in this area.

Also list the cross band systems and linked systems somehow. Look up the ZIA connection in AZ & NM. 8 (I think) systems - what goes in on one comes out on all. Ditto the Condor 220 system in CA. Perhaps clicking on one would show the coverage of the one, plus a zoom-back icon when clicked woudl show the coverage of the network (just OR the coverage zones, then zoom to fit the display).

>When ever I travel I scan the bands for activity and key words so I know
>that I can add something to the discussion. Maybe you could add the voice
>recognician feature as well as the active scan feature to your interface.

I don't think there is a standard voice recognition system except the Windows Sound system, and it's recognition doesn't work very well with the limited audio bandwidth (300-3khz) from the average handy scratchy. The idea is nice, but not as valuable as the info block or the GPS feature.

>With out the added features I think your product would only appeal to
>statistitions and wanabe repeater coordinators...certainly not to any of
>us that want to find a good QSO on the bands or make an emergency call.

When can I buy one? Preferrably with the current ARRL directory as the included data base.

: SB NJHAM @ ALLUSA $DEPE1
: DEP May Impose Fees on YOU!
:
: The Department of Environmental Protection and Energy in New Jersey is
: proposing a fee pertaining to owners of RF generating devices. In summary,

(snip)

This has the potential for leading to an interesting court case. In the early 1920's, the US Supreme Court held that ALL radio communications were in fact interstate commerece. The US Constitution reserves the authority to regulate interstate commerece to the federal government. Any tax or fee imposed on the basis suggested in this note is a direct attempt by a state to regulate interstate commerece - and may be voided in federal court if anyone bothers to spend the $$$$ to fight it.

That the state has an interest in protecting the health of its citizens is undeniable. What has not been shown is that the level of exposure to RF from many of the sources listed are in any way harmful. Based on the scanner law contoversy in NJ, one is tempted to think that there is someone of influence in NJ who just doesn't like Amateur Radio!

VK2WI BROADCAST, 2nd January, 1994

Welcome to the first morning/evening broadcast for 1994, and we trust that all our listeners survived the celebrations. We still have several dead transmitters, so there will be no broadcast on 160m AM, 10m SSB, 6m SSB and 2m SSB. These transmitters will be repaired when personnel become available.

The major news items this week include:

A New Year Broadcast
Council meeting in Wollongong
Annual General Meeting
FM-828 Bonanza
Packet Users meeting
NTAC Chairman resigns

Divisional News

A New Year Broadcast

As mentioned, this is the first "live" VK2 Broadcast for the new year. We believe that some Divisions will not commence their Broadcast until later on in the month, so in the meantime those Members and listeners bereft of a local Broadcast are invited to tune in to VK2 instead. The regular evening Broadcasts will also re-commence tonight, and call-backs on most frequencies will be taken.

Council meeting in Wollongong

There will be a meeting of the Divisional Council held in Wollongong, at the Illawarra SES headquarters in Montague St, starting at 7.30pm. The meeting was requested by John Simon VK2XGJ. The purpose of the meeting is to consider urgent NTAC business, set a date for the EGM as requested in a petition to consider a Motion of No Confidence in Council, and to continue with business left over from the previous meeting to consider a Motion of No Confidence in the Divisional Secretary. The next Council meeting at Parramatta will be on Friday 21st January.

Office hours

Following a well-deserved break, the Divisional Office will be open as usual from Monday 10th January, at the usual hours of

11am to 2pm Monday to Friday, and 7pm to 9pm on Wednesday nights. Thank you Margaret, and we hope your in-tray will not be too full!

Annual General Meeting

Don't forget that the AGM has been set for Sunday 10th April. The closing date for agenda items and nominations is Monday 28th February.

FM-828 Bonanza

Members and Clubs may be interested to know the the Division has obtained over five hundred "FM-828 high-band" VHF radios, for subsequent disposal. They were donated by a large telecommunications company in a ceremony attended by the President, Vice-President and Secretary. There will be further details in a later Broadcast.

Trash and Treasure Sale

The next Divisional Trash and Treasure is scheduled to be held at Amateur Radio House, Parramatta, on Sunday 23rd January.

Packet Users meeting

Listeners interested in the development of packet radio in the Sydney area are invited to an informal meeting at Amateur Radio House, 109 Wigram St, Parramatta, on Sunday 23rd January, starting at 2pm. Please contact Darryl VK2TDS for more details.

NTAC Chairman resigns

Cesar VK2TCM, the Chairman of NTAC (the NSW Technical Advsiory Committee) has resigned from that position, effective immediately. Cesar claims that the Committee cannot function effectively, as there is too much control imposed by the Council, and the long delays in approvals are causing much ill-will amongst the Clubs.

Vanity Callsigns in USA

Listeners may be aware that the USA regulatory body, the FCC does not charge for Amateur licences, and as a result there are no resources avauilable to permit Amateurs to pick their own call sign. This could soon change. The FCC has released its Notice of Proposed Rule Making, in PR Docket 93-305, to permit amateurs to choose a ``vanity'' call sign. Individuals as well as trustees of club stations would be eligible to request an available call sign from the block assigned to their licence class or a lower licence class.

A fee would be required. The Communications Act specifies a fee of 7 dollars per year for amateur service vanity call signs, and allows the Commission to require payment of small fees in advance

for a number of years not to exceed the relevant licence term. Fee issues would be resolved under a separate FCC rule making proceeding, and a vanity call sign system would not be started until then.

The applicant would provide a list of up to 10 total call signs desired. The FCC would assign the first available requested call sign from the applicant's list. If none of the desired call signs was available, the applicant's current call sign would be reassigned. Call signs of lapsed or deceased licensees would not be available for reassignment for two years. A call sign relinquished under the vanity call sign program would be available for reassignment immediately.

-- From the ARRL Bulletin

WICEN News

This is a quiet time for WICEN, barring the usual unforeseen emergencies that seem to happen at this time of the year, so this is an appropriate time to overhaul the Sydney WICEN repeater system on 7150/8275. A dual-band high-gain antenna has been borrowed, and it will be placed in service, replacing the current temporary antenna, as soon as practicable. Casual users of this repeater system are reminded that except during net times and other activations, there is a 30-second timeout; you will soon get used to keeping your overs short to avoid getting the dreaded raspberry.

The next major exercise is the annual Bungonia Cave Rescue, on the weekend of 19-20th March. Further details will be provided in a later broadcast. The next Committee meeting will be on Saturday 12th February.

The Sydney WICEN net, normally held every Thursday at 9.30pm on repeater 7150, is in recess and will re-commence later on in the month. In the meantime, this would be a good opportunity to brush up on your communication skills, and ensure all your equipment is in working order for that sudden activation.

-- Dave VK2KFU, WICEN (NSW) Publicity Officer

Broadcast Summary

Summarising the articles in this news broadcast so far:

We note the passing of Reg VK2YL last month.

The VK2 Broadcasts are now "live" again, every Sunday morning and evening, and callbacks will be taken. The office re-opens on Monday week, the 10th January.

There will be a meeting of the Divisional Council held at the Illawarra SES headquarters in Wollongong, starting at 7.30pm.

The purpose of the meeting is to consider urgent NTAC business, set a date for the EGM as requested in a petition to consider a Motion of No Confidence in Council, and to continue with business left over from the previous meeting to consider a Motion of No Confidence in the Divisional Secretary.

The AGM has been set for Sunday 10th April. The closing date for agenda items and nominations is Monday 28th February.

Over five hundred "FM-828 high-band" VHF radios will soon become available from the Division.

Listeners interested in the development of packet radio in the Sydney area are invited to an informal meeting at Amateur Radio House, 109 Wigram St, Parramatta, on Sunday 23rd January, starting at 2pm. Please contact Darryl VK2TDS for more details.

Cesar VK2TCM, the Chairman of NTAC (the NSW Technical Advsiory Committee) has resigned from that position, effective immediately, claiming that the Committee cannot function effectively.

Club News

Central Coast Amateur Radio Club

Amateur radio operators, their families, friends and those interested in amateur radio are invited to attend the 1994 GOSFORD - CENTRAL COAST FIELD DAY which will be held on Sunday 27th February 1994 at the prestige venue, the WYONG RACECOURSE. Gates open at 9:00am. TRADING AND ALL ACTIVITIES WILL COMMENCE AT THE NEW TIME OF 9:00AM.

Registration is $8 for adults, with children under 12 free, $5 for Seniors and Pensioners. Special group concessions are available on application. The usual attractions will be available, and there will be seminars and workshop sessions. Please listen to future broadcasts for further information.

-- From a packet bulletin by David VK2UDT

>So:

>3.5795454545 megaHertz / 455 = 7.867132866 kHz / 262.5 = 29.97003

I find it interesting that this colourburst frequency of 3.5795
MHz is right smack in the amateur radio 80 meter band. It seems
that any and all ham operators can legally send morse code at that
frequency at the legal power limit of 1 killowat output and screw up all of
the colour tvs in the cities. How come this doesn't appear to be
such a problem?

Well, maybe we could let people choose for the kind of examn to get their HF license.
1) CW examn
2) A very tough theoratical examn (much tougher than for those who'll do the CW). Followed by a practical test, in which they show their ability as a correct radio-operator.

Hence you get a system in which both categories have proven their knowledge, and you'll get good operators (and the bands still don't get that crowded).

Source record: 272726

"It's illegal to sell drugs, but the police do it. It's illegal to buy stolen goods, but the police do it."

But they do NOT actually do those things as such; they're trying to arrest the people on the other side of those "transactions," and as long as those are people who intended to commit crimes (buying dope, selling stolen goods) I have no problem with it.

"It's illegal to speed, but police do it without the required emergency signals."

Excellent point there. There was a case a while back where a woman got fed up with sheriff's deputies' speeding and actually pulled some of them over and tried to make citizen's arrests on them; she ended up being arrested herself for speeding (in trying to overtake them), and the court ruled that while she DID have authority under the law to make the citizen's arrests she had NO authority to break the law in trying to do so.

"It's illegal to serve a warrant for a technical tax violation with concussion grenades..."

No argument there.

> but might be usable with a good preamp.
>
Gary is being very kind to this radio. I have one and when I bought it I
knew just what to expect from it. I use it mainly for terrestrial ssb/cw
contacts and contests. The thing in its stock form is DEAF! But with a
20dB low noise preamp mounted inside the radio, it is very usable. I paid
$85.00 for mine and I personally knew the person from whom I bought it.
It had been realigned so that you could work above and below 432.100 without
switching channels and had also been tweeked to the nth degree before I
built and put in the preamp. It does drift which is ok for contests buif
you are ragchewing, you end up turning the vxo as the other person is
talking. I personally think that $150.00 is a bit high. The 3 or 4 of them
that have changed hands up here have sold between $85 and $125. Of course
this is relative to what's available in your area and the size of your
finances. $150.00 is not an awful price but it is not a great price
either unless the preamp is included.

Steve KA0VYB

Microwavers do it with higher frequency

29. Re: VK2WI Weekly News, 2nd January, 1994

Newsgroup: rec.radio.amateur.misc

And as an apparent result of this and two previous alleged illegal broadcasts, the NSW Divisional Council has closed down, until further notice, the Divisional repeaters and packet stations VK2RWI. The locks have apparently been changed (again) to ensure no further transmissions are made from VK2WI and VK2RWI.

Good morning and a very Merry Christmas. It's Sunday the 26th of December and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines: The new RSGB President is to be installed in January, RSGB Headquarters is open during the Christmas holiday and we bring you our traditional Review of the Year.

The RSGB's 1994 President Ian Suart, GM4AUP, will be officially installed at an evening reception and dinner in Glasgow on Saturday the 15th of January. Any RSGB member wishing to attend should contact RSGB HQ without delay.

For those needing to call at RSGB Headquarters or make a telephone enquiry during the holiday period, HQ will be open this Wednesday, Thursday and Friday.

The Swindon 70cm Repeater GB3TD returned to service on Saturday the 18th of December, after a site and channel change. The new channel is RB3 so the repeater can be heard on 433.075MHz. Reports would be welcomed by the Repeater Keeper G4XUT, from whom further details can be obtained. His address is correct in the RSGB Call Book.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Ascension Island, ZD8M will be very QRV on the low bands especially 160 metres, from today, Sunday the 26th. From Martinique, F3WC is signing FM5WC until Saturday the 5th of February. From Mozambique, SM6DRM is active as C91BH from now until the end of January 1994, on 10 - 20 metres, including the WARC bands, on CW and SSB.

There's one item of HF contest news:

The first RSGB LF Cumulative 3.5MHz Contest takes place next Sunday the 2nd of January from 1600 - 1800 UTC. The rules can be found in the December edition of Radio Communication.

And now our review of the year as brought to you by the RSGB's GB2RS News Service. We are very grateful to newsreader Vic Kusin, GM4HCO, for researching and compiling the review.

This week we deal with January to June, and next week July to December.

On Saturday the 2nd of January 1993, nearly a hundred people attended a dinner to see Peter Chadwick, G3RZP, formally installed as the 59th President of the Radio Society of Great Britain. One of his first tasks as President was to present a certificate to Britain's astronaut Helen Sharman OBE, marking her election as an Honorary Member of the Society.

The Pentland South Pole Expedition was well under way. Explorers Ranulph Fiennes and Mike Stroud had already walked over 1,000 miles and crossed the South Pole at the beginning of January. Their progress was reported by Lawrence Howell, GM4DMA, whose wife Morag, who was using the callsign GB4MSS/VP8 from Patriot Base in Antarctica. The aim of the expedition was to be the first to cross the Antarctic continent on foot and at the same time raise two million pounds for research into Multiple Sclerosis.

The chairman of the RSGB VHF Committee, Peter Burden, G3UBX, reported that the United Kingdom, along with other European countries, had agreed to the use of 433.050 to 434.790MHz for 'low power devices' limited to 10 milliwatts. Following representations from the RSGB, the Radiocommunications Agency had undertaken to defend the amateur service in the event of problems being experienced. It was stressed that this allocation should not in any way affect the present or future status of the amateur service on the band.

At the end of January, the RSGB introduced a premium phone line, carrying a recording of GB2RS news bulletins, mainly intended for those who were not able to receive the regular broadcasts. The number is 0336 407394 and calls are charged at 36 pence per minute cheap rate and 48 pence per minute at all other times. A proportion of the proceeds goes to the RSGB.

On Sunday the 31st of January, Charlie Suckling, G3WDG, and his XYL, Petra, G4KGC, made two contacts on the 10GHz band via moon-bounce. These were the first 10GHz Earth-Moon-Earth contacts made from Britain and were with WA7CJO in Phoenix, Arizona. Charlie Suckling was at time the RSGB's Microwave Manager.

In February, the Radiocommunications Agency announced the completion of its review of the amateur radio Novice Licence Scheme. The allocations to Novices in the 3.5 and 28MHz bands were increased to enable the use of the accepted low power frequencies. Also increased was the 50MHz allocation, allowing Novices the use of Morse, telephony and data. The 70cm band allocation was extended to include 432 to 440MHz, which allowed the use of SSB telephony, slow scan and fast scan television.

An excellent tropo event started on Thursday the 4th of February and carried on into Saturday. GJ4ICD reported that during this period many long distance stations were worked on 432 and 1296MHz. Of special note was the first Jersey to Czechoslovakia QSO on 1296MHz. This was between GJ4ICD and OK1FFD. Conditions were believed to have been the best for many years.

Meanwhile, Sir Ranulph Fiennes and Dr Mike Stroud became the first men to have crossed the continent of Antarctica on foot, entirely unsupported. Not content with this, and despite failing health, they decided to continue walking to their final destination, Scott Base, a further 350 miles. The expedition's communications officers, Morag, GM0MUV, and Lawrence, GM4DMA, were featured in the national media, explaining the trials of the two explorers. Later in the year, Sir Ranulph Fiennes and Dr Mike Stroud were both awarded OBEs in the Queen's Birthday Honours List for their achievement in the fields of 'Human Endeavour and Charitable Services'.

The Radio Society of Great Britain presented a cheque for just over 4,500 to MENCAP, the Royal Society for Mentally Handicapped Children and Adults. The presentation was made by RSGB President Peter Chadwick, G3RZP, to MENCAP's Chairman, Lord Rix, G2DQU, at a ceremony held at RSGB Headquarters on the 19th of February. The money had been raised by RSGB members and staff during 1992.

For several days at the end of February, a special event station, GB0OSH, was operating at the 'Radio GOSH' studio at Great Ormond Street Hospital in London. Attending the opening ceremony was His Royal Highness Prince Philip who is Patron of the RSGB. He was introduced to the event organiser Justin Johnson, G0KSC; RSGB President Peter Chadwick, G3RZP and RSGB General Manager Peter Kirby. Prince Philip used a VHF transceiver to talk to a surprised G4IGK in Aylesbury. Two HF stations were operational during the event and a number of young patients were able to use the hospital's internal telephone system to connect with the amateur radio stations and pass greetings messages over the air.

Amateur radio was in the national news again at the beginning of March. Radio amateurs provided the sole means of communication between the beleaguered villages in Bosnia and the United Nations relief agencies. A week later, the news media continued to give favourable reports of amateur radio being used inside Yugoslavia to assist the United Nations in their humanitarian relief efforts. The RSGB heard of one UK amateur who also managed to help - Jim Atherfold, G0FZB, of Shoreham-by-Sea, Sussex, was called on 20m by YU1ADJ, requesting medicine which was urgently needed to save the life of a young man in a Belgrade Hospital. He was able to pass this message to the Red Cross for further action. This was followed by a very favourable newspaper report which praised amateur radio.

At an RSGB Council Meeting held on the 12th of March, an application from RAEN Limited for Affiliation was discussed, and considered at some length. Council decided that the Society was able to affiliate RAEN Ltd as the Management Committee, but not the individual Groups associated with RAEN Limited. However, the Society saw no reason why individual Groups should not seek affiliation.

The RSGB's Project YEAR Co-ordinator, Hilary Claytonsmith, G4JKS, was awarded the title 'Amateur of the Year' by the magazine Ham Radio Today. The announcement was made at the London Amateur Radio Show on the 14th of March. Hilary is a member of the RSGB Council and her work in the fields of EMC, HF Contests and recruiting young people into amateur radio is well known to members.

On the 1st of April, the Radiocommunications Agency announced additional frequencies for radio amateurs for unattended digital communications, as well as the removal of restrictions on amateur radio transmissions on 70cm in the North East of England. The additional frequencies followed a request from the RSGB to extend the frequencies available for packet radio in order to enhance access to packet radio mailboxes.

The RSGB's Monitoring System, otherwise known as the Intruder Watch, had four successes which benefited all radio amateurs. An Argentinean fax, a naval data transmission and two diplomatic stations had been removed from the 18MHz band

with the assistance of the RA. The Co-ordinator of the Intruder Watch is David Owen, G0OES, and details of the role of the Monitoring System can be found in the RSGB Call Book.

The Royal Grammar School of Guildford became the first school outside America to have a direct colour TV link to the space shuttle Discovery. In addition to the video link, there was two-way voice contact between the shuttle and pupils during two orbits on the 9th of April, using the callsign GB6STS. Deputy Head of Science Frank Bell, G7CND, said that the equipment worked well and there was an interference-free six-minute radio contact. When the slow-scan TV image was sent, KB5AWP on the Discovery reported receiving a good clear picture. G7CND organised the school's radio equipment for the contact, but it was the pupils themselves who controlled almost all of the voice and TV exchanges.

In May, the Arfon Repeater Group announced that, for the first time in the UK, a 2m and a 70cm repeater were to be cross-linked. Under a special licence granted to the group issued following negotiations between the RSGB and the RA, GB3AR on R4 could be linked with GB3AN on RB4 by means of DTMF tones, with the result that the two repeaters operate as one. The Repeater Group pointed out that the set-up was experimental and invited everyone to make good use of the linking system and to report results, good or bad to Brian Davies, GW4KAZ.

On Saturday the 19th of June the RSGB held an Open Day at its Headquarters in Potters Bar. Over 200 members attended, many bringing with them their families and friends. They were treated to a guided tour of the RSGB's offices, had a chance to operate in the GB3RS shack and to visit the QSL Bureau, Library and Museum. Also at the Open Day was a team from the BBC's Arena programme who were researching for a feature on amateur radio.

One of the best known radio amateurs in the world is King Hussein of Jordan, who is frequently active as JY1. In an interview given exclusively to the RSGB's Radio Communication magazine, His Majesty revealed his wish to promote amateur radio in Jordan. He also explained how he became interested in the hobby and his belief that amateur radio contacts provide a wonderful way to make friends.

And that concludes our review of the first half of 1993, as reported by GB2RS.

And now the solar factual data:

This week due to GB2RS being prepared early we are short of data. For the period 13th to 16th solar activity has declined to very quiet levels; this was not expected. There have been no flares reported. The spot indices have declined and meaned at only 29. The solar flux has also declined and averaged only 85 units. The geomagnetic activity was quiet up to the 16th, when a magnetic storm was reported affecting mainly the higher latitudes. The period averaged an Ap of 10.7 units. However the indices rose from 3 on the 14th up to 28 by the 16th. This is believed to be due to the passage of a coronal hole. The state has been 'nil, nothing to report'. The radio quality indices have been at normal levels all the period, there being no very good or bad paths on any circuit. We do not have the aa indices to hand. The X-Ray Flux averaged B1.0, about the level it has been since last October. However,

completely unexpectedly it collapsed on the 16th to only A4.5 units the lowest level since this data has been given on GB2RS. Bartells rotation 2191 begins on December 30th.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon, averaged 8.7MHz. The daily highs are now occurring around 12.00 hours. The darkness hour lows are almost steady and averaged 2.7MHz. There have been periods of Spread F, blanketing E and other phenomena but only lasting for around 2 hours daily.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg have been affected by whatever magnetic activity was about, and levels have been depressed averaging only 5.5MHz. The darkness hour lows were also down and averaged only 2.2MHz. At last the seasonal changes in IF2 critical frequencies can now be seen; if a mean line is drawn through the data, levels have risen from about 7.5MHz last June up to 8.25MHz at present. This is lower than expected; last year at this time levels were up to 11MHz.

And lastly the solar forecast:

This week, the more active side of the sun will be looking our way, and solar flux levels are expected to be about 100. The geomagnetic activity is expected to be very unsettled, possibly up to sub storm on the 28th to 30th then declining to quiet levels. The Ionospheric Radio Quality Indices are expected to decline down to poor by the 29th.

And that is the end of the solar information.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Next, the local news.

NEWS FOR THE SOUTH EAST

Meeting for Monday the 27th of December:

Basingstoke Amateur Radio Club has a Two Metre Direction Finding Competition 'The Turkey Settler' Map OS-185(SE) with Alan, G8FMH as the Fox. Further details by telephoning 0256 25517. NEWS FOR SOUTH WEST

Meeting for Wednesday the 29th of December:

South Bristol Amateur Radio Club has 'Greetings to old Friends on 2m and 70cm from the Club station'. For further information tel: 0275 834282.

NEWS FOR THE MIDLANDS

Meeting for today Sunday the 26th of December:

Charnwood Amateur Radio Contest Club has a Club Net. For further information telephone 0509 232927.

Meeting for Wednesday 29th of December:

Telford and District Amateur Radio Society will hold an 'On the Air, Christmas Time Net' on 144.600MHz, starting at 8pm. Contact Dave, G4EIX, on 0952 588878 for details.

NEWS FOR THE NORTH OF ENGLAND

Meeting for Monday the 27th of December:

Goole Radio and Electronics Society has a Video - a look back at 1993, hosted by Jim, 2E1BHL. Further details from Steve, G8VHL on 0405 769130.

Meeting for Tuesday the 28th of December:

Liverpool and District Amateur Radio Society has an Open Night. Further details from Ian, G4WWX who is QTHR.

And that's the end of this week's GB2RS news broadcast, which was prepared by the Radio Society of Great Britain.

31. rsgb gb2rs news 2nd jan 1994

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-02 12:49:12 UTC
From: ted@tedb.demon.co.uk
Message-ID: <757514952snz@tedb.demon.co.uk>
Source record: 272579

Good morning and a Happy New Year. It's Sunday the 2nd of January and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- G3RZP is the new LAC Chairman; the 1994 LF Cumulative contests start this week and we have the second part of our review of the year, including a propagation review.

The RSGB's Licensing Advisory Committee has a new chairman. He is Peter Chadwick, G3RZP, the RSGB's Immediate Past President. He takes over from John Bazley, G3HCT, who will be the committee's Secretary.

The RSGB's 1994 President will be officially installed at an evening reception and dinner in Glasgow on Saturday the 15th of January. Any RSGB member wishing to attend should contact RSGB HQ without delay.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Svalbard (Hopen Island), LA5EBA will sign JW5EBA from now until July 1994, on all bands, using various modes. And from Thailand, K3ZO will be active as HS0ZAR from mid-January for four weeks.

We have no rally news for you this week as the next event notified to us is not until Sunday the 23rd of January 1994.

HF contest news now:

The first RSGB LF Cumulative 3.5MHz Contest takes place today, Sunday the 2nd of January. Another one takes place on Saturday the 8th of January. Both are from 1600 - 1800 UTC. The first LF Cumulative 1.8MHz Contest takes place tomorrow, Monday the 3rd of January from 2000 - 2200 UTC. December's RadCom, page 84, gives detailed information on all the LF Cumulative Contests. The RSGB AFS Team CW Contest takes place next Sunday the 9th of January from 1300 - 1700 UTC on 3.510 - 3.590MHz, with the 3.570 - 3.590MHz reserved for slower-speed contacts (the QRS Corral).

Next some VHF contest news:

The RSGB 144MHz CW Single Operator Fixed & All Others Contest takes place on Sunday the 16th of January, from 1000 to 1600 UTC. There are three sections:- Fixed station single operator, Open and Listeners. See December's RadCom, page 83 for details.

And now for the second part of our traditional Review of the Year. We are very grateful to newsreader Vic Kusin, GM4HCO, for researching and compiling it.

In July, the RSGB announced the first ever RSGB 50MHz Certificate to go to the holder of a UK Novice Licence. This was issued to Pat Williams, 2E1AFN, when she claimed the 50MHz, 10 Countries two-way Award. Congratulations also went to Geoff Brown, GJ4ICD, who was issued with the first certificate for having

the grand total of 450 locator squares confirmed on 50MHz.

Once again the RSGB was in the forefront of publicising amateur radio in the media. Broadcast on the 24th of August was a BBC World Service programme called Waveguide, which featured amateur radio and the RSGB's role for the previous eighty years. The following week, the programme looked at a typical amateur radio station. 'Waveguide' was transmitted world-wide and provided excellent international publicity for amateur radio

The RSGB Standard Distance Award for 24GHz was awarded to Bill James, G6XM, for a contact from his portable site on Dartmoor with G3GNR/P on Exmoor at a distance of 43km. Bill, who is a lifetime member of the RSGB, has been collecting the Society's awards since November 1979 when he received Supreme Award number 29 in recognition of his activities on the 144, 432 and 1296MHz bands. He is the only person to hold an RSGB Supreme Award together with distance awards for 10 and 24GHz.

Two hundred thousand members of the public had a chance to see amateur radio in action at London's Olympia in September. The RSGB put on a stand at the five-day spectacular LIVE '93 exhibition. A very large number of people visited the stand, many expressing interest in amateur radio. There were many questions on licensing, and about such things as packet and slow scan. Three stations were operational: HF, VHF and UHF packet, and the data communications demonstration proved to be the most popular.

The RSGB made a donation of 1,000 to the UK's amateur satellite organisation AMSAT-UK in support the Phase 3D project. At a ceremony at RSGB Headquarters, RSGB President Peter Chadwick, G3RZP, handed over the cheque to AMSAT-UK Secretary Ron Broadbent, G3AAJ.

An RSGB delegation, comprising experts on all aspects of amateur radio, attended the International Amateur Radio Union Region I Conference at de Haan in Belgium. A number of changes were made to our band plans, concerning data frequencies on HF and priorities on the Microwave bands. The HF RTTY allocations were renamed 'Digimode' to cover all digital modes, including RTTY, AMTOR, PACTOR, Clover and Packet. In some cases the allocation was increased in size. On the microwave bands a number of sub-bands were agreed on an international basis in order to counter increasing pressure from commercial concerns. IARU Region I covers all of Europe and Africa as well as the former Soviet Union.

On Sunday the 26th of September, four more amateur radio micro-satellites were successfully put into orbit, including two built at the University of Surrey. They were KITSAT-2, ITAMSAT, EYE-Sat and POSAT-1.

This year's Young Amateur of the Year Award ceremony was on the 9th of October. The principal guest was Roger Louth, Director of Mobile Services at the Radiocommunications Agency. Also in attendance was RSGB President Peter Chadwick, G3RZP. The Young Amateur of the Year was fifteen-year-old Tim Munn, G7OTO, from the Isle of Wight. He was selected from a list of nominees after interviews by the Radiocommunications Agency and the RSGB. Tim has become an RSGB Novice Instructor and his courses have had a 100% pass rate so far. The

runner-up was Simon Kahn, who became G0STU on his 14th birthday, having passed the RAE aged 11. He was one of the first Novice licensees, holding the callsign 2E1AAB.

The RSGB's 1993 HF and IOTA Convention took place at Old Windsor in Berkshire. This was a convention in the traditional style, with an opportunity to meet friends, socialise and attend a range of lectures and presentations. The programme comprised 25 items, all DX or contest related, and all were well attended with some lecture rooms packed to capacity. More than 180 people attended the DX Dinner. Amongst the presentations made was the award of the Calcutta Key to Hans Berg, DJ6TJ, for his services to amateur radio through the International Amateur Radio Union.

On Thursday the 14th of October the Society was represented at the funeral of Arthur Milne, G2MI, who passed away after a long illness. He was responsible for the RSGB QSL Bureau for over 40 years. Arthur became RSGB President in 1954 and was the senior GB2RS News Reader for many years until just before his death.

The weekend of the 16th and 17th of October saw the 36th Jamboree on the Air. For 24 hours Scouts and Guides all over the world used amateur radio to celebrate their shared interest.

The 1st of December marked the inauguration of a new 10GHz beacon, GB3KBQ, built by the Mendip Repeater Group to commemorate the life of John Moxham, G8KBQ. John, who died in 1989, had a fascination for microwave technology and was always willing to give advice and a helping hand. The beacon runs 60mW on 10,368.87MHz from Taunton.

The Society's Annual Meeting took place in Manchester on the 4th of December. The Honorary Treasurer, Richard Horton, G4AOJ, reported that the Society has been very successful in its aim to balance income and expenditure. The Ostermeyer Trophy for the best construction article in RadCom was presented to G3VML for his VHF transceiver project. The Wortley-Talbot Trophy for outstanding experimental work was presented to G3WDG and G4KGC for their 10GHz activities. The Fraser Shepherd Award for research into microwaves went to G4JNT, and the Pilot Officer Norman Keith Adams Prize for the most original article in Radcom went to G4FHU for 'How Big is a Bad SWR?'

And that concludes our review of the year 1993, as reported by GB2RS.

And now the solar factual data, starting with a brief forecast for this week, followed by a review of the year's propagation: These have been compiled, as they are each week, by Charlie Newton, G2FKZ, who is the Chairman of the RSGB's Propagation Studies Committee.

This week the more active side of the sun will rotate away with solar flux levels declining to be about the 95s. The Ionospheric Radio Quality Indices is expected to be about normal or slightly below. Geomagnetic activity is expected to be mainly quiet.

Next our review of 1993's propagation:

1993 has, to say the least, been an eventful year. Solar cycle 22 is still full of surprises. The rise in sunspot indices was the fastest ever recorded, which led to forecasts that it would be a record cycle. Alas it was not to turn out that way. We are now seeing a decline in spot indices, again is so rapid that cycle 22 is puzzling all the experts. Having had their fingers burned on the way up they are now all very quiet about when the minimum might be, and forecasts are now for only one year ahead, with December 1994 having a spot index of about 32. World-wide the interest in the ionosphere is continuing to decline, so data sources are declining as well. This makes ionospheric forecasting more difficult. However it is not all gloom. We hope to have a new ionosonde installed at the Rutherford Appleton Laboratories at Chilton which should give us data early in the New Year. Spot minimum times have in the past been very good for sporadic E and 1993 was no exception. During June there was one of the greatest sporadic E events almost anyone can remember, with openings particularly on 6 metres to many parts of north America by stations only using very low power. As for the HF bands, the radio quality indices were above normal for 113 days, just normal for 125 days, and well below normal for 108. The worst period was during May with the 6th to 15th being the worst for many years. The best times were possible during late April and most of October, but the good times do not last long. Though ionospheric and solar data is declining, the geomagnetic data sources are now growing by the day. It is now possible to obtain geomagnetic data from around the world via Intermagnet and the Geomagnetism Information and Forecast Service. At present 30 observatories send data to the British Geological Survey at Edinburgh and within 2 years it is expected to enlarge to about 100. For those who belive the 6 metre band is dead, reports have been received that the sporadic E season in Australia is in full swing, and this seems to be following the pattern that we had last June, with contacts to JA being plentiful. VK3OT states that, on 50MHz, F layer contacts to Europe have been made every year since 1988 on the 24th of December. We would like to know how you got on this year - reports please to G2FKZ whose address is correct in the RSGB Call Book.

And that is the end of the solar information.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Next, the local news.

NEWS FOR THE SOUTH EAST

Meetings for Monday the 3rd of January:

Braintree and District Amateur Radio Society has a talk entitled 'Widgets 2' and a discussion on 'The Club Open Day'. Further details from John, G1WQQ on 0787 60947.

Surrey Radio Contact Club has a talk on 'Oscilloscopes for Amateurs' by Phil, G0OHI and Peter, G3ZPB. Details from Bernard, G8TB on 081 660 7517.

Meeting for Tuesday the 4th of January:

Stevenage and District Amateur Radio Society has a Welcome Back evening with a Discussion, VHF/UHF on Air and CW Practice with Frank, G4ISO. Contact Neil, 2E1ASZ on 0438 350882 for details.

Meetings for Wednesday the 5th of January:

Chesham and District Amateur Radio Society has its '1994 Club Programme Meetings' session. Details from Ian, G0RTF on 0494 676391.

Dover Radio Club has a Novice Evening. For further details telephone 0304 825030.

Worthing and District Amateur Radio Club has a talk entitled 'Surveying in Malta'. Details G4GPX on 0903 753893.

Meetings for Thursday the 6th of January:

East Kent Radio Society has a talk entitled 'Packet Radio' by G3EMU. Further information from Paul, G3VJF on 0227 364606.

Horndean and District Amateur Radio Club has a talk by Keith Ridley, Deputy Editor, 'The News' a Portsmouth area local newspaper. Further details from Stuart, G0FYX, tel: 0705 472846.

Horsham Amateur Radio Club has a talk entitled on 'The Story of Wireless' by John, G0GNA. Details from Peter, G8SUI on 073784 2150.

Shefford and District Amateur Radio Society has a Welcome-back Meeting. Contact Paul, G1GSN on 0462 700618 for further details.

Vange Amateur Radio Society has a Junk Sale. Contact Doris on 0268 552606 for further information.

Meetings for Friday the 7th of January:

Loughton and District Amateur Radio Society has a talk on 'Word Processing' by John, G1DJI. Further details from John Tel: 081 508 3434.

Medway Amateur Receiving and Transmitting Society meets for 'The VIP Quiz' by John, G6IVP. Further details from Gloria, G7OVI on 0634 710023.

NEWS FOR SOUTH WEST

Meeting for Tuesday the 4th of January:

Salisbury Radio and Electronic Society has a talk by Emma, 2E0 who has applied for DXCC. Details from David on 0722 330971.

Meeting for Wednesday the 5th of January:

Exmouth Amateur Radio Club has a Junk Sale. Phone 0395 279574 for further details.

Meeting for Thursday the 6th of November:

Yeovil Amateur Radio Club has a Practical evening - 'VHF FM Hand Rig Deviation checks' by G3AIK. Contact Cedric, G4JBL on 0258 473845 for further

information.

Meetings for Friday the 7th of January:

Axe Vale Amateur Radio Club has a talk entitled 'Radio in Shanghai' by Graham, G0GTR. For further details contact Pat, G0GHH on 0297 33756.

Shirehampton Amateur Radio Club has its Club shack clear-out evening. For further information contact Ron, G4GTD on 0272 770504.

NEWS FOR EAST ANGLIA

Meetings for Tuesday the 4th of January:

The Amateur Radio Club of Fakenham has a talk on 'Microwaves' by John, G4BYV. Contact Dave, G4DCJ on 0485 528633 for further details.

Sudbury and District Radio Amateurs has a talk on 'Computers, with Hardware' by Nigel, G0ORI. Contact Tony, G8LTY on 0787 313212 for further details.

Meetings for Wednesday the 5th of January:

Martlesham Radio Society has a talk entitled 'Packet BBS, Past, Present and Future'. Contact Darren, G7BKO on 0473 227332, during office hours only for entry ticket details and for further information.

Norfolk Amateur Radio Club has a Quiz evening. For further details contact Sheila, G0KWP on 0603 618810.

Meeting for Friday the 7th of January:

Cambridge and District Amateur Radio Club has a Video evening. Contact John, G0TIL on 0763 243570 for details.

NEWS FOR THE MIDLANDS

Meeting for today Sunday the 2nd of January:

Charnwood Amateur Radio Contest Club has its New Year meeting. For further information telephone 0509 232927.

Meeting for Monday the 3rd of January:

Stourbridge and District Amateur Radio Society has a Discussion and an "On Air" night. Further information from James, G7HEZ on 0384 374354.

Meetings for Tuesday the 4th of January:

Loughborough and District Amateur Radio Club meets for a discussion "Ideas for 1994". For further details contact G8SNF by telephoning 0509 218259.

Grantham Radio Club has a talk on 'Intruder Watch' by Dave, G4MQM. For further details contact John, G8WWJ on 0476 65743.

Meetings for Wednesday 5th of January:

Derby and District Amateur Radio Society has its New Year Surplus Sale. Contact Hayley, G7PXA on 0773 856904 for further information.

Telford and District Amateur Radio Society has the club Equipment availability check. For further details contact Dave, G4EIX, on 0952 588878.

Meeting for Thursday the 6th of January:

Cannock Chase Amateur Radio Society has a talk on 'Heraldry' by J M Sanders, MBE. For further details telephone 0543 262495.

Meeting for Friday the 7th of January:

South Notts Amateur Radio Club meets for its Annual General Meeting. For further details contact Julie, G0SOU on 0602 216342.

NEWS FOR THE NORTH OF ENGLAND

Meeting for Tuesday the 4th of January:

Liverpool and District Amateur Radio Society has a Quiz evening. Further details from Ian, G4WWX who is QTHR.

Meetings for Wednesday the 5th of January:

Denby Dale and District Amateur Radio Society has a talk entitled 'Why you should make a Will, and how to do it' by Ian, G6TSW. Further details from Ivan, G0SBR on 0484 429238.

Wirral Amateur Radio Society has a visit to Atlantic House. For further details contact G3FOO, tel: 051 644 6094.

Meeting for Thursday the 6th of January:

Trafford Amateur Radio Club has a talk entitled 'HMS Bronnington, G0TON' by Peter, G3XGE. For details contact Malcolm Collis on 061 748 8046.

Meetings for Friday the 7th of January:

Goole Radio and Electronics Society is holding a Repeater Report, hosted by Steve, G8VHL. For further details contact Steve, G8VHL on 0405 769130.

South Manchester Radio Club has a Mini Lecture Contest evening. For further details contact Edward, G7FQY, tel: 061 969 1964.

NEWS FOR WALES

Meetings for Thursday the 6th of January:

Meirion Amateur Radio Society has its Annual General Meeting at the Royal Ship Hotel, Dolgellau. The meeting opens at 7.30pm for an 8pm start. Contact Maurice, GW3GKZ on 0341 422447 for further details.

Dragon Amateur Radio Club has an 'Evening Together to Greet 1994'. Details from Tony, GW0FMQ, tel: 0248 600963.

NEWS FOR NORTHERN IRELAND

Meeting for Friday the 7th of January:

Bangor and District Amateur Radio Society has a Quiz Night, starting at 8pm in the Winston Hotel, Queens Parade. Details from Keith, GI0SSA on 0247 883315.

And that's the end of this week's GB2RS news broadcast, which was prepared by the Radio Society of Great Britain.

32. Daily Summary of Solar Geophysical Activity for 01 January

DAILY SUMMARY OF SOLAR GEOPHYSICAL ACTIVITY

01 JANUARY, 1994

/\

(Based In-Part On SESC Observational Data)

SOLAR AND GEOPHYSICAL ACTIVITY INDICES FOR 01 JANUARY, 1994

NOTE: Intense stratospheric warming is persisting over central and
northeastern Siberia, Alaska, and the Siberian and Canadian Arctic.
Warming is slowly weakening. Temperature gradient is reversed
between 60N and the pole in the middle and upper stratosphere from
30 HPA upwards.

SYNOPSIS OF ACTIVITY

Solar activity was low. Small flares and weak surging
accompanied the limb transit of Region 7640 (N10W93).
Occasional C-class flares occurred from Regions 7645 (N13E30),
7646 (S08E27), and 7647 (S14E20), as the focus of activity now
shifts to the eastern hemisphere. Region 7645 is the largest

and most complex spot group on the disk.

Solar activity forecast: solar activity is expected to be
low to moderate.

The geomagnetic field was predominantly unsettled at mid-
latitudes. High latitudes had stints of minor storm conditions
during local nighttime hours.

Geophysical activity forecast: the geomagnetic field is
expected to be unsettled to mildly active the next 48 hours.
Quiet to unsettled conditions should end the interval.

Event probabilities 02 jan-04 jan

Class M 50/50/50
Class X 05/05/05
Proton 05/05/05
PCAF Green

Geomagnetic activity probabilities 02 jan-04 jan

A. Middle Latitudes
Active 20/25/20
Minor Storm 20/10/10
Major-Severe Storm 01/01/01

B. High Latitudes
Active 20/20/20
Minor Storm 30/30/20
Major-Severe Storm 01/01/01

HF propagation conditions were near-normal to slightly
below-normal for the first 3/4 of the UTC day over the low and
middle latitude regions. Minor signal degradation was observed
during the local night hours due to enhanced geomagnetic and
auroral activity. Conditions were poor to occasionally very
poor over the high and polar latitude paths, again attributed
to the elevated levels of geophysical activity. Conditions
over all regions recovered relatively quickly when geomagnetic
and auroral activity subsided to quieter levels by the end of
the day. Near-normal conditions should return to all regions
on 02 and 03 January, with above-normal propagation possible
over the lower and some middle latitude regions. Openings on
higher bands near (or above) 10 meters should be observed for
greater periods of time as the current level of solar flux
continues to strengthen the ionosphere.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

So, what are you suggesting?? That there be no test at all??? If so, just
go to CB and use it. 11 meters is HF after all! I'm not about to tell you
that allocating more space to efficent digital methods is a bad
suggestion, actually that's the only constructive piece I saw in your
message, but doing away with testing would destroy amateur radio once and
for all.

> self up yet either. 73....Roger

Call Icom on the phone and request the schematic to the SM-8. This will show you the pin connections on the 8-pin connectors and the up/down buttons.

Call Kenwood on the phone and request the schematic for their Microphone. This will show you how the Up/Down function is implimented on their radio.

I assume you are asking because you do not have any documentation on either the radio or the microphone.

The Operators Manual for the TS-850 will cost about $25. This beats the repair bill that will result from killing something inside the radio.

The Icom achieves up/down by pulling a single pin on the mic. connector either to ground or to ground hrough a 470 ohm resistor. The Kenwood uses 2 separate pins to select up or down.

By and large they aren't the same people. Harold Robbins, Howard Stern, and Madonna capture most of the book buyers who aren't science fiction readers (the largest book purchase category). BTW the newspaper with the highest circulation isn't McPaper (USA Today), it's the National Enquirer. In essence, you can't underestimate the intelligence of the average reader; you can't imagine IQ numbers that low. But we know they can read, we can see their lips moving in the checkout line.

> I wonder what perecentage have VCRs and video rental cards.

Most of them have a VCR, but it always flashes 12:00, 12:00, 12:00 unless they have a child in the house who can set it for them. Thus we have VCR+ where you have to input an arbitrary sequence of digits instead of simply inputting that you want to record Ch 2 at 8pm. Not that it's going to work anyway, unless that child cabled it up for them.

> I know that many homes I visit have few or no books. I am alos
>stunned by the number of radio amateurs that do not have any manuals
>or handbooks on their favourite hobby.

Ah, you just hang out with the wrong class of people. Why I know *several* Hell's Angels with great (comic) book collections, and tons of motorcycle magazines. It must be true that radio amateurs don't read much, however, since QST, 73, and CQ don't have circulation figures of more than a fraction of licensed amateurs.

> Could the lack of literacy be related to the falling numbers

Source record: 272587

HR AMSAT NEWS SERVICE BULLETIN 001.01 FROM AMSAT HQ
SILVER SPRING, MD January 1, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-001.01

A number of messages have recently been posted to the AMSAT BBS concerning the schedules for the various satellites and how they are arrived at. In the case of OSCAR-13, the schedule is determined by the AO-13 Command Team consisting of James Miller G3RUH, Peter Guelzow DB2OS and Graham Ratcliff VK5AGR. As to how these volunteers determine the schedule, a very fine set of comments was posted by Paul Beckmann WA0RSE Internet address wa0rse@amsat.org. The AMSAT News Service thanks Paul for his well-put comments and has taken the liberty of extracting them for this bulletin.

Paul begins by asking himself: What determines the mode schedule for a satellite? He says thae he found an answer in the very clearly written piece in the 1993 Space Symposium Proceedings by, you guessed it, James, G3RUH.

In his attempt to put the article by James in terms that may not be obvious to new to satellites as well as many not so new "bird-watchers", Paul offers a list of some of the important considerations:

1. All modern satellites are battery-powered with solar cell recharging systems. In order to work, the batteries must stay charged.

2. Most satellites do not have solar cells covering their entire surface. This means the attitude of the satellite with relation to the sun must be managed to keep the batteries charged.

3. The antennas are fixed to the satellite, not steerable, and necessarily "go along for the ride" when accomplishing Item 2.)

4. Each mode involves a receiver, a transmitter, and a pair of antennas. The receivers vary in sensitivity, the transmitters in power, and the antennas in gain and beamwidth.

5. Because of Item 3, the characteristics of item 4 allow transponder operation only in particular modes, when the distances and spacecraft attitudes are within certain limits. For example, a narrowbeam antenna pointing away from the Earth will not support communications. If a particular mode requires the use of that antenna, it would not do any good to place the satellite in that

mode, no matter how badly it was desired. To change the attitude of the spacecraft to point the antenna at the Earth could very well compromise solar cell illumination, hence battery charge, hence spacecraft operation - and possibly even its life expectancy.

6. Because some modes draw more power than others, the battery power must be budgeted. This also constrains how long the satellite can operate in any particular mode.

Paul admits to possibly missing some other major points, but he believes that these demonstrate to him, at least, that the mode schedule on AO-13, or any other bird, is not a self-serving decision made by some "elite superclass" who treat the bird as a "toy", but are considered decisions, constrained by the physics of the orbit, solar cells, batteries, equipment aboard, antennas, etc., designed to offer the best long-term schedule of transponder operation and to further the state-of-the-art for the next birds' designs.

WA0RSE strongly suggests reading the article by James in the Proceedings. He says that he was amazed at the number of specialized programs that had been written, complete with graphical output, to aid in the decision-making process to keep the AO-13 satellite operational. He expressed his opinion that James, and others like him, should be thanked for bringing clear explanations like these to the rest of us and for fostering experimentation in modes that have proven to provide better two-way satellite communications for our fellow hams across the globe.

Paul sums up his message by saying that we need everyone interested in AMSAT, with their opinions, tempers, passions, talents, and good humor. He also wishes all a Happy New Year. Peace on Earth. Good will toward all.

Information on ordering a copy of the Space Symposium Proceedings, which contains James Miller's article can be found on page 12 of the Nov/Dec AMSAT Journal.

/EX

>such a problem?

Primarily because there are so many TV sets spewing garbage out on that
frequency that nobody would ever be heard if they were to use it. The
advantage, though, is that you can tear the colorburst oscillator out of
a TV set, and skew it a little bit up or down the band and have a nice
QRP rig.

SB DX @ ALLBBS $OPDX.141
Ohio/Penn DX Bulletin No. 141

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 141
BID: $OPDX.141
January 1, 1993
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DF4RD, DL7VEE & DXNL, OZ1FJB, AD1C, K4CEF & Southeastern Cluster Group, KJ4VH, WA4JQS, AC4CS, K8YSE and KE9A for the following DX information.

1B, NORTHERN CYPRUS. The DX Advisory Committe was advised by Cliff Watson, KR4M, to table his petition for Turkish Republic of Northern Cyprus. No definite reason was given, but there are negotiations going on
between both Greek Cypriot and Turkish Cypriot to resolve intercommunal differences and to create a new federal system of government. SPECIAL NOTE (from the Editor): The OPDXB has been accused of promoting the "1B operations" which is WRONG! OPDXB does not promote or take sides, but it is a "DX news service", and like all the other DX news publications, it reports on activites and events on the air.

3Y, PETER I ISLANDS (ALMOST CALLED OFF!). The entire DXpedition was almost aborted when it was discovered the icebreaker that was scheduled to pick up the DXpedition team from the island for the return trip, would
not be able to schedule a stop for the pickup. The team has been working feverishly behind the scenes for weeks to change this situation. It has involved lots of liason work, telephone calls and visits into Russia in order to solve the problem. They now have a Russian ship that will make the pickup. There are very few ships in the world that can make such a pickup and are equipped to have helicopters to bring the gear off the island. Thanks to a lot of perserverance by the entire team, and within just a few days of the drop-dead date for aborting the DXpedition, the Russians magically came through with an offer of help. So the DXpedition is now back on track again. However, the team had to spent over $2000 in telephone calls, plus plane tickets for some of the Scandinavian team to fly into the Russia to solve the problem. This is a very expensive DXpedition and if you would like to help contribute to this operation,

send contributions to KA6V. The team will be departing in mid-January for Port Stanley in the Falkland Islands. The landing date for Peter I is February 1st. The DX-team is made up of the following: Ralph/K0IR (Team Leader), Tony/WA4JQS, Terry/W6MKB, Bob/N4GCK, Peter/ON6TT, Bob/KK6EK, Luis/XE1L, Willy/HB9AHL and MR. Martin Tosseyn/Researcher. Also read VP8 below. Special Note: Tony, WA4JQS, has stated he has been working the past few months on plans for a DXpedition to Heard Island with an operation to Kerguelen Island afterwards.

4U1ITU, ITU HQ (on RTTY). Wolfgang, DK7UY, will be active from January 3rd to 7th, in Geneva to test some DX-pedition equipment from the ITU-Headquater station 4U1ITU. He will operate mainly on RTTY on 15, 17 and 20 meters, but also some CW and SSB operations will take place on all the other bands. QSL's for this activity ONLY via bureau to DK7UY.

4Z85TA, ISRAEL (SPECIAL EVENT STATION). From January 1st through April 30th this station will be on all bands and modes (RTTY, PACKET, SSTV, AMTOR, PACTOR, CW and SSB) to celebrate the 85th anniversary of the founding of the city of Tel-Aviv. A special QSL will be sent to everyone contacting the station. Also, a special award certificate signed by the mayor of Tel-Aviv will be available (listen for details). Award and QSL manager for 4Z85TA goes to 4X6LM, Shlomo Mussali, P.O.Box 8225, Tel Aviv 61081 Israel.

9K, KUWAIT. Bob, N6BFM, has signed up for another year in Kuwait as 9K2ZZ. Currently he is home in Atlanta, but will be active from Kuwait in another week. He is taking back a 40 meter beam with him which was donated by some W8's in Michigan. Bob's QSL manager is Ray, W8CNL. It has also been announced that Ray's son, Derek, KC4ELO, has now become the QSL manager for Tom, 9K2ZC, and his XYL, Donna, 9K2YY. Address for both W8CNL and KC4ELO is 674 Crestlyn Dr., North Augusta, SC 29841.

BV0ARL/BV9P, PRATAS ISLAND. There was a glimmer of hope for this operation
to take place the day after Christmas, but a FAX sent by Martti Laine, OH2BH/VR2BH, and received by Ron, K6OZL, states it was called off at the last minute to allocate space for officers heading to Pratas and for more
valuable cargo. The next tentative scheduled try is for late February or early March. FROM THE RUMOR MILL (Just before going to print!): From a conversation that was overheard on 75 meters Sunday morning. The rumor now circulating states that two phone calls from a BV operator to some K7 stations informed them that there may be a short operation from BV9P on Jan 5, 1994 for 4.5 hours only (from 0300-0730 UTC). Frequencies to watch are reported to be 14020, 14260, 21020, 21260 and two frequencies on 17 meters which were missed in copying the info. Antennas that will be used are a sloper and dipoles. The rumor says that the opertors will be several BV ops and Martti. There is supposed to be a follow up operation which will be a much bigger effort in March. All of this is band-chatter at this point, but may be good dope. WFWL. This information from AC4CS.

HK0, MALPELO & GORGOLA ISLANDS. Rumors have been circulating that IT2RAO/HK0 will be operational from Malpelo January 4-7, and from Gorgola Island (in the Valle/Cauca Division group) January 12-15. Very little information is available on either of these operations, but the operator has mentioned that the IOTA numbers are: SA-007 for Malpelo and SA-017 for Gorgola. So you might keep an eye on the IOTA freqs. This is a surprising operation. Malpelo has been a restricted area and authorites
only authorize DXpeditions about once every 7 years.

HUANGYAN DAO (SCARBOROUGH REEF). Hans, DK9KX, has sent a petition to the DXAC for DXCC Country status for this one. Hans feels that Huangyan Dao qualifies under Point 2 (a) of the DXCC Countries Criteria. Huangyan Dao,
a possession of the Peoples Republic of China (PRC), is an uninhabitated island situated in the South Chinese Sea. The petition states that the island is in excess of 225 statute miles from the nearest point of the PRC, with nothing between it and the mainland. (15 deg 7'N, 117 deg 51'E)

S2, BANGLADESH. Carl, SM6CPY, will be active until January 11th. His call
sign is unknown at this time, but plans to emphasize his activity on 30, 80 and 160 meters. There was a station active on New Year's Day signing S21ZZ on 10102 kHz at 1500z which could have been him. Meanwhile, Eric, S21ZG, continues to be active on 14226 DX Net around 1330z, and before that time, he can sometimes be found on 20 meter CW. QSL S21ZG via W4FRU.

SAD NOTE: Khalid, A61AB, at the age of 24, became a silent key December 17th, due to accident with his microlight airplane. Khalid was instrumental in helping non-Emirates residents to operate amateur radio in his country.

T5/OZ1FJB UPDATED AND QSL CARDS. Lars, T5/OZ1FJB, states he made 1500 QSOs (95% were CW) in the period of May 1st thru September 31st, from Garbaharre in Somalia while working for the UNHCR as a Radiotechnician and Operator. QSL cards will be printed the first of January. Also, Lars has a new address: Lars E. Hinrichsen, Graeshavevej 17, DK-2730 Herlev, Denmark.

VP8, FALKLAND ISLANDS. Before the 3Y operation, Ralph/K0IR, Peter/ON6TT and a civilian member of the DX-team will arrive on the Falklands 4 to 5 days ahead of the rest of the DX-team because of the lack of seats on the R.A.F. flight. The early arrivers plan to do some low band operations
as VP8BZL (Tony/WA4JQS's call) while they are waiting for the rest of the
team to arrive later in the week. They will try to be active mainly on 160, 80 and 40 meters CW and SSB. QSL via KA6V.

XF4, REVILLA GIGEGO. Per an operator at XF4CI, on 3795 kHz at 0722z on December 31st, the team will pay special attention to HF CW on the last

three days of the DXpedition (January 4,5,6). The XF4CI was also active on 160 meters SSB the same day at 0330z and 0600z. They were also heard on OSCAR 13 at 0640z, 145.900 MHz.

XZ4TA WAS ACTUALLY 4Z4TA. In OPDX.140 we reported on two QSN reports on a
XZ4TA from the cluster networks. Ken, KE9A, believes these reports were actually 4Z4TA, not XZ4TA.

KEEP THOSE BALLOTS COMING! (Only a month to go!) Ballots for the Third Annual OPDX/NODXA DX Survey can be found in OPDX.137. Ballots can be sent to the following packet and online addresses listed below.

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and the FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

```
SB ALL @ ALLBBS $OPDXNODXA.2
OPDX/NODXA 1993 DX Survey

THE THIRD ANNUAL OPDX/NODXA DX SURVEY.
Here is your chance to be counted. Deadline will be January 31, 1994,
with results in February. The questions of the survey will deal with:

1) The DXer of the year. This is a DXer who you thought was outstanding
in operating and handling the pile-ups from their DXpedition.
2) DXpedition of the Year (Group and Indivdual). Choose the best and most
well organized DXpedition that met the needs of the DX community.
3) The 30 Most Wanted Countries. Choose your 30 most wanted countries.
4) OPTION: Your personal comments about DXing in 1993.

Please use the ballot below. Votes will only be accepted in the
following format below.

-------------------------------------------------------------------
Your | DXer of the Year| DXpedition of the| DXpedition of the
Callsign | (Person) | Year by a person | Year by a group
and QTH | | |
-------------------------------------------------------------------
CHOOSE YOUR MOST WANTED COUNTRIES. (Please list only 30 of your most
wanted countries. List CW and SSB modes separately.
CW - AB,CD,EF
SSB - GH,IJ
-------------------------------------------------------------------
Comments on DXing in 1993: (Text Any Length)
-------------------------------------------------------------------

* Just Fill-in The Blanks And Send It To One Of The Three Address:
"Packet Radio" - KB8NW @ WA8BXN.OH.USA.NA
"InterNet" - aq474@cleveland.freenet.edu
"PRODIGY" - DFJH48A

OPDX/NODXA DX Survey

Example Ballot:

: advantage, though, is that you can tear the colorburst oscillator out of
: a TV set, and skew it a little bit up or down the band and have a nice
: QRP rig.

Actually, I have found just the opposite to be true.

The colorburst frequency is not only cast in stone-it is extremely accurate.
It is more accurate as a frequency reference than WWV. This is provided
that you are tuned to a network-supplied program.

If you try to receive 3.57954545 mHz near a TV, you will hear almost nothing.
In fact, the only way to take advantge of the precision of the colorburst is
to lock an oscillator to the 7.867 kHz signal radiated by the very strong
magnetic deflection circuit.

I know about this first hand. I wish their *were* a bit of 3.57954545 mHz
leakage from a TV; it would make calibrating a lot easier.

Am I missing something here? is there a reason why a TNC and a VHF/UHF
radio can't share the same 12v power supply?

46. FT-530 Receive Problems

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-03 01:57:40 UTC
From: leber@panther.warm.inmet.com
Message-ID: <CJ16s5.Mr3@inmet.camb.inmet.com>
Source record: 272593

In recent digests, I found mention of at least 2 people who had experienced
a 'clicking' sort of interference in their Yaesu FT-530's, along with
statements that this was a known problem with a factory fix. Unfortunately,
the 'from' lines in the digests do not seem to indicate the actual originator
of the message, but rather the news gateway (or something like that, anyway),
so I can't contact the posters directly.

Can anyone describe the symptoms more specifically? I have a new 530,
and the only problem I have is with interference that does sound a bit
like ignition noise. It does not appear all across the 2m band, but rather
seems concentrated in patches around 145.130 (at least that's the only
placed I noticed it so far).

Also, can this problem be fixed by authorized Yaesu service techs at
dealers, or does it have to go back to Yaesu?

Normally, I would just ignore this, but it happens to lie smack on top
of one of my club's repeater frequencies, so I'd like to resolve it,
if possible.

Thanks,
Tom

Congratulations on the Tech+! It took me 13 weeks earlier this year to get my
Tech No-code in the mail. Then on October 30th I passed my 5wpm and missed t
General theory by 2 questions (without ever seeing the question pool I
may add). I am now enjoying 10M ssb so much, I am going to go for the General
so I can play with voice on the other bands.

Anyway, good job and welcome to the hobby.

48. Strange Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-03 03:36:49 UTC
From: ep208@garnet.berkeley.edu
Message-ID: <2g83sh$8p2@agate.berkeley.edu>
Source record: 272594
Cross-posted to: sci.electronics,rec.radio.amateur.misc

A few minutes ago I observed a Mercedes with what appeared to me to be a strange antenna on it. The antenna was just above the rear window, in a location where celular phone antennas are often found. The antenna looked like a loop about 3 cm in diameter, and there was a second loop the same size at 90 degrees to the first one.

Can someone tell me what it is for?

49. help with antennas

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-03 04:12:57 UTC
From: gdlee@bsu-cs.bsu.edu
Message-ID: <5403@bsu-cs.bsu.edu>
Source record: 272598
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc

I would like to put up a random (long) wire antenna for listening
to shortwave and ham broadcasts. However, all the books and articles
I have seen on the subject of antennas have lots of pictures and not
enough words. This is a problem as I am totally blind. Could
anyone give me some advice about the following questions?

1. Should I go with a long wire or a dipole or inverted V type
antenna?

2. If I go with a long wire, how should I arrange it to be
as omnidirectional as possible, or just put up two, oriented
at right angles?

3. Whatever I put up, I would like to put it in my atic to
avoid climbing around on my roof and maybe up into trees.

4. How do I get the best ground withoug knocking holes in the
walls of the house?

5. Whatever I put up, I would like to share the signal
between 3 different receivers in three different rooms of the
house. What is the best way to do this?

Thanks for any and all replies. Please be as wordy as you
need to be. Also, please don't send those diagrams made of
"|" and "-". I wouldn't be able to see them anyway.
Thanks again for any help.

In article <2g7p56$9s9@crl2.crl.com>, lreeves@crl.com (Les Reeves) writes:
> The colorburst frequency is not only cast in stone-it is extremely accurate.
> It is more accurate as a frequency reference than WWV. This is provided
> that you are tuned to a network-supplied program.

Is this still true?

I have no direct knowledge, but... many years ago (mid-70's if I remember right) one of the hobby electronics mags (I think it was Radio-Electronics) had an article for a frequency standard derived from a color tv. Soon afterward a letter appeared in the letter column (where else :-), written by an engineer at one of the better-equipped stations in L.A. He stated that even network-supplied programs taken from a live feed usually go through a time-base corrector at the local station, and that this breaks the "chain of traceability" back to the network's precision frequency standard.

(of course, anything that the local taped from a satellite feed for broadcast later is completely divorced from any standards at the network.)

Also, at that time it was stated that the networks used rubidium-clock frequency standards, which are secondary standards: They're awfully good but they still have to be calibrated against something better. NIST (the folks who run WWV) uses cesium-beam clocks, which are primary standards, needing no calibration for frequency. Have the networks since upgraded to cesium-beam clocks? And, given that the local stations probably haven't, does it matter anyway? Even if they have, they're still "only" as good as NIST's clocks, so why should one over-the-air signal be better than another? (propagation changes on shortwave, maybe?)

* *
* New Jersey says it wants to tax every radio transmitter *
* in the state and some hams may try to grab 10 1/2 meters *
* from the freebanders. *
* *
* *

NEW JERSEY RF FEE

New Jersey, the state that two years ago tried to jail hams who had rigs in their cars and more recently tried to force Radio Shack to stop selling scanners with cellular coverage now wants to put a tax on every radio transmitter in the state! The New Jersey Department of Environmental Protection and Energy is proposing a fee on owners of almost all RF generating device. Transmitters that are both commercially and privately owned.
The proposed rule will require the owners of any source of radio frequency and microwave radiation between the frequencies of 300 KHz and 100 GHz and which have the potential of exposing either workers or the general public to radiation levels in excess of the regulatory limits to register those sources with the Department within 60 calendar days after the effective date of this rule. The owners of all units that are subject to this rule shall be assessed an initial registration fee and will be required to provide technical information on each piece of equipment to the Department. After the first year of the program, the owners of registered units will be assessed an annual renewal fee. The amounts of the proposed fee are based on the services to be performed by the Department. As a reference, the median fee for commercial users will be approximately $500 per antenna per year if this proposal is passed.
Radio frequency sources definitely falling under the proposed legislation include AM and FM radio stations, television stations, commercial microwave ovens, cellular telephone systems, radar installations, microwave point-to-point links, ground-to-satellite telecommunications links, and other communications services. Radio frequency and microwave sources are also widely used in industrial heating and sealing operations and will be included as well. Although fees are not yet outlined for Amateur Stations, ham radio is mentioned in several sections of the proposal as being a significant source of radio frequency radiation. A source that the state says poses health risks to the general public.
A hearing to discuss the rule will be held on January 11th in the Department's Public Hearing Room in Trenton, New Jersey. The Department will accept comments on the proposed regulations until January 20th. Comments should be addressed to Janis E. Hoagland, Esq., Administrative Practice Officer, New Jersey Department of Environmental Protection and Energy, Office of Legal Affairs, C N 402, Trenton, New Jersey, 08625-0402.
Those outside New Jersey aren't out of the clear on this issue. If this proposal passes into law, it could be justification for other states to take similar action. It might even lead to a national ruling on radio frequency radiation that could seriously damage the ability of Amateur Radio to fulfill the basis and purpose that it was created to serve. Newsline will keep you updated on this one.

*****
TAKE BACK 11 METERS

If you are not on packet then you may not be aware that a growing number hams around the nation are sounding a call to arms. A call with the aim of taking part 11 meters back from Citizens Radio and turning it over to Novice and no-code Technician class hams.

No, its not a joke. In fact, those involved seem very serious and are looking to do it the right way. The political way by petitioning the FCC to make the change.

The debate on this issue started a few weeks ago on packet when Tom Saluti, N1KIO of New Durham New Hampshire posted an All United States bulletin dealing with the subject. If you are active on packet then you are aware of the high level of support that Tom's idea has. For those of you who are not packeteers, heres the story.

In his posting, N1KIO called the 11 meter band -- more accurately the 10 1/2 meter Freeband as being -- and we quote -- a wasteland that even the government can't use. This Tom says is because operators have taken it over from 26.000 to 28.000 MHz and sometimes even make excursions into the 10 meter ham band.

He went on to note that with the FCC having taken away some frequencies from Amateur Radio that it might be time for them to give some spectrum back. This by abandoning their own efforts to handle the 10 1/2 meter problem and turn 27.500 to 28.000 over to the Amateur Radio service. He says that radio amateurs can easily solve the mess by permitting Novices and Techs to run CW and data from 27.500 to 27.700 and voice operation from 27.700 to 28.000 MHz.

Since its posting, the N1KIO bulletin has been highly controversial. Not over the idea of running the illegal operators off of 11 meters and getting it reassigned as a ham radio band. Almost every commenter wants to see that happen. The problem seems to be on how to do it.

Many hams appear have a high level animosity toward the Freeband illegals but a number question how to get the FCC to take the request seriously. One responses gaining a lot of support suggests that a petition be circulated by packet radio where signatures and call signs could be added. Then, after a few months a final print out can be sent to the Private Radio Bureau as a rule making request.

No matter what the outcome of the discussion going on packet, one thing is certain. A fire is being fanned by a desire of no-code hams to have access to the high frequency bands. It is growing, and the illegal operators on 10 1/2 meters may soon find hot cinders falling in their self proclaimed Freeband as radio amateurs take a political route to oust the current crop of illegal operators and open 10 1/2 meters to ham radio. Stay tuned.

*****

PARAMOUNT FINED

Much of the FCC's staff is away on vacation, so there is nothing new in the case of alleged violations of Amateur Radio testing rules by a number of Southern California Volunteer Examiners. But before the commission went into recess, it did levi a big fine against a Houston, Texas television station.
The Federal Communications Commission has fined Paramount Communications television station KTXH-TV in Houston, Texas $80,000 for violating a law limiting the number of commercials a TV station may air during children's programming hours.
The fine represents the largest punishment ever handed out to a TV station since Congress passed a 1990 law requiring broadcasters to meet the educational needs of children. An appeal by Paramount is expected.

*****
RADIATION PROOF IC's NEEDED

Keith Baker, KB1SF of AMSAT North America says that the Phase 3D satellite development team has identified an urgent need for some radiation hardened, low power CMOS type 1802 microprocessor chips. These are not the standard off the shelf variety of 1802's, but rather the type that have been certified for operation in a spacecraft environment. If any of our listeners has source or pricing information on these components, please drop a note to Dick Jansson WD4FAB at his callbook address or fax him at 407-644-9782. These IC's are needed to make the new Phase 3D satellite fly!

*****
NO 222 - 222.150 MHZ LISTINGS

When the next issue of the ARRL's Repeater Directory premieres in April, there will be no listings of repeaters that may still be operating between 222 and 222.150 MHz. Newsline has learned that the decision to drop the listing of repeaters operating in that 150 Khz window is based on a recent FCC rules change. A change that reserves that spectrum for weak signal operations by barring any and all relay operation from it.
Once implemented, any repeater or remote base venturing into the band between 222 and 222.150 MHz will be in violation of the FCC rules. The operators of such systems will be subject to severe penalties if they are caught. Apparently the ARRL does not to be viewed as fostering pirate repeater operations. The decision to drop these systems from public listing seems to be its way to make this position known.

*****
THIS WEEK IN AMATEUR RADIO RETURNS

A satellite delivered ham radio program is returning to the air after being homeless for just over a month. Producers of "This Week in Amateur Radio" say they're back, but on a different satellite.

Community Video Associates, which produces the program, says it has reached an agreement to get the show back on the air starting January 1st. This Week In Amateur Radio began airing in March. It lasted till late November when the program lost its satellite air time. George Bowen, N2LQS is the CVA's President. He says the program will air on the Galaxy III satellite under an agreement with the new Omega Radio Network. Air times will be Saturday at 7:30pm EST. Bowen says the network is donating the satellite time as a service to the amateur radio community. This Week In Amateur Radio carries a variety of ham programing including Amateur Radio Newsline. The show is free and available for rebroadcast on local amateur radio repeaters.
If you'd like to listen to This Week in Amateur Radio, here's more information on the Galaxy III satellite. Tune in transponder 19, 5.8 MHz wideband audio. Galaxy III is located at 93.5 degrees west longitude. Again, air times are Saturdays, starting at 7:30 p.m., Eastern time. Welcome back!

*****
NEW RAIN DIAL UP SERVICE PHONE NUMBER

Chicago's popular Rain Dial Up Service has changed its telephone number. As of Thursday December the 30th, the new number is area code (708) 827-7246. The Rain dial up provides repeaters and other bulletin stations with in depth reports on subjects of contemporary interest to the ham community. Again the new number is area code (708) 827-7246 or simply (708) 827-RAIN.

*****
AMATEUR RADIO INDUSTRY GROUP TO HOLD FIRST MEETING OF '94

The Amateur Radio Industry Group will hold its first formal planing meeting of 1994 on Friday evening, February 4, at the Miami Airport Mariott Hotel, Miami, Florida in conjunction with the 34th annual Tropical Hamboree. All manufacturers, publishers, importers and dealers serving the ham radio marketplace are invited to attend. The Meeting room number will be posted in the hotel lobby and circulated among all exhibitors at the Hamboree. Sorry, this meeting is not open to the general public. For more information or to arrange to make a presentation at the meeting please contact John Dorr, K1AR, Chairman of the Amateur Radio Industry Group, at CQ Communications, 76 North Broadway, Hicksville, New York 11801. John can be reached by telephone at area code (516) 681-2922 or you can Fax him at (516) 681-2926.

*****
CZECH OPERATION

In DX, word that a station signing OL1A and claiming to be operating in the Czech Republic had been rumored to be a pirate.

Now comes word from W9GSB who says that's definitely not the case. Lou reports that he has received a card for the operation. OL1A turned out to be a special contest station operated by OK1DFP and several others. If you also made the contact, QSL via OK1DWX.

*****
DXCC UPDATE

The ARRL has announced that A61AF cards are acceptable for DXCC credit, but only for QSO dates after August 3rd, 1993. The League says that all operations prior to that date were unauthorized, and not good for DXCC. If you were among the many who submitted an A61AF card prior to November 16th, 1993 you are going to have to resubmit. This is because all prior A61AF credits have been removed from the League's DXCC database.

*****
ARRL RTTY CONTEST

A reminder that the annual ARRL RTTY Roundup takes place next weekend from 18:00 UTC on January 8th to 24:00 UTC on January the 9th. According to W1FB there were two date announcements made for the contest. The official notice in QST listed the correct date while the announcement in CQ Magazine that the competition would be held New Years weekend was wrong.

*****
ORIGINAL MARCONI KITES DISCOVERED

Joe Chamberlin, VE3ABG reports via packet that some of the original kites used in the early 1900's by radio pioneer Guigliermo Marconi have been found. The kites were discovered during a recent Marconi plant clean-up in Montreal. Plans are to donate some of the kites to the Marconi Museum in St. John's, Newfoundland. This is where early trans-Atlantic transmissions took place from Signal Hill. VE3ABG also says that contrary to rumors going around, the Marconi company officials do not plan on offering them up for public auction.

*****

For this year, that's all from the Amateur Radio Newsline. You can write to us at Post Office Box 463 in Pasadena, CA 91102.

From Bill Pasternak, WA6ITF at our editors desk, and all the rest of the Newsline staff around the world, we wish you a great 1994.

SYNOPSIS OF ACTIVITY

Solar activity was low. Only a few C-class subflares
occurred. Regions 7645 (N12E18) and 7646 (S09E14), both about
600 millionths in area, have been stable. Little else of
significance was reported.

STD: A relatively insignificant major M6.5/SN flare erupted out
of Region 7645 at 02/2256Z. The flare was rather impulsive and

was not associated with any notable radio emissions.
Additional M-class flares are possible from this region, with
an outside chance for an isolated X-class event. It continues
to show a fairly complex magnetic structure. A delta
configuration is also still quite evident within the region.

Solar activity forecast: solar activity is expected to be
low.

The geomagnetic field was at quiet to active levels.

Geophysical activity forecast: the geomagnetic field is
expected to be quiet to unsettled throughout the period.

Event probabilities 03 jan-05 jan

Class M 25/25/25
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 03 jan-05 jan

A. Middle Latitudes
Active 30/20/20
Minor Storm 10/10/10
Major-Severe Storm 01/01/01

B. High Latitudes
Active 20/20/20
Minor Storm 30/30/20
Major-Severe Storm 01/01/01

HF propagation conditions were normal over all regions.
Ionospheric strengthening is evident. Openings on 6 meters are
becoming increasingly possible over some middle and many lower
latitude regions. High latitudes are also observing somewhat
better propagation conditions, although some night-sector
signal instabilities are persisting. The major M6.5/SF flare
had only a minor ionospheric impact on daylit paths. The
short duration of the flare prevented a strong and lasting SWF.
Similar conditions are expected over all regions during the
next 3 days. Additional sudden ionospheric disturbances (SIDs)
are possible over the next week.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max, and end times are defined as: B = Before, U = Uncertain, A = After. All times associated with x-ray flares (ex. flares which produce associated x-ray bursts) refer to the begin, max, and end times of the x-rays. Flares which are not associated with x-ray signatures use the optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

That sounds like a cellular antenna to me. The last time I dropped by my cellular carrier's office to pick up a quick charger for my Moto hand-held unit, I noticed some antennae on display. One of those was a very short stalk with two vertical loops perpendicular to each other, passing though the axix of the stalk.

Tehre wasn't really anthing on the display that would suggest that said antenna was any better than any of the others, just different. In fact, it was not the most expensive on display. The most costly was a hinged model that mounts on the trun lip. When not in use, it could be folded out of sight under the trunk lid. It was pretty large and looked more CB-like than cellular. Still, not a bad idea.

>
>Is this still true?

No, and it never was except in some very special cases. Because of the
way the terrestrial telco microwave distribution was done, the reference
phase changed during the course of the day.

That's correct, though the device is actually called a frame synchronizer.
The broadcast subcarrier is referenced to the station master sync generator,
and that's usually a simple crystal controlled oscillator. The FCC tolerance
on subcarrier is +/- 10 Hz so a crystal reference is good enough.

>(of course, anything that the local taped from a satellite feed for broadcast

>changes on shortwave, maybe?)

The networks have abandoned the rubidium references and use crystal
oscillators today, just like the local stations. With the change from
telco microwave distribution to satellite distribution, there is enough
doppler that a tight reference is worthless anyway. Geosync satellites
really aren't precisely geosync. They describe small figure 8s in their

position boxes, and this introduces enough phase variation through path length changes, and enough frequency error through doppler, that you can watch the subcarrier vector rotate one way then the other if you reference the vectorscope to the uplink signal while watching the downlink signal. There's a several Hertz +/- error that varies over the course of the day.

up to June 1993 the service is on ftp.tu-ilmenau.de path pub/msdos/ham/qslroutes
Since then this service is not supported by the editors.
Please read the following README file from this path.

---------- begin README ----------

This directory contains the supplements of "QSL Routes - World Annual of QSL Managers."
1993 ff.
It is edited by Theuberger Verlag, Box 73, D-10122 Berlin, Germany.

Remarks: (18.08.93)

This update services is not longer supported than to June 93 via ftp.
Owners of the Book get the updates by mail.

If you want to get a free of charge test of "QSL-ROUTES"
2nd edition 1992 + supplements 1992 (or 1993 edition if
92 is no longer available)
you can write a letter to:

Theuberger Verlag GmbH
P.O.Box 73
D-10122 Berlin
Germany

You should include 2 US$ or 3 IRC or 3 DM (stamps) at least
for surface mail and an address label.
---------- end README ----------

Remarks at the end:

I have checked the ftp-logs and watched that a lot of hams
downloaded that files. But never one emailed me...
I would provide this service for you in the future but...
...the editor told me that he doesnt want to support that
service by ftp up to the time I will tell him the email adresses
of a serious number of peoples (hams & netters) who are owner of a book
"QSL-ROUTES" and those hams express their interest in getting
the updates by email, maillist, ftp?....
So: if you are interested in this service email me or mail
to the editor for a free test.

> Chris Craig
> KD4HDE

That's not what I read into his statement at all. (Though it would be
nice if it were formated correctly and spell checked :-)) He's saying
we should eliminate the irrelevant Morse test. I won't go into whether
Morse is useful/useless here, my position is well known, but the *test*
is useless since Morse users must know Morse to use it, by definition.
So if access is granted to spectrum where Morse is permitted, the operator
is going to have to gain competence in Morse to use it. Whether there's a
government test or not is irrelevant since the relevant test is on the air
operation.

Simply put, those who don't know Morse will do no Morse until/unless
they learn Morse.

Obviously, the Morse test is not the *only* test required of an amateur.
So he's not advocating eliminating testing in general. (At least that's
my interpretation of what he's saying.) Now you may or may not agree with
me on the following, but I think the current written exams are totally
inadequate to serve their intended purpose. That purpose is to make sure
the applicant knows enough to avoid injury to himself or others, knows
enough to detect, and possibly correct, transmitter faults that could
cause interference to other services (opening the envelope and finding

the pink ticket isn't adequate for this purpose), and knows enough to operate within the other amateur regulations. That's the sole legitimate function of government testing. Since the Morse test doesn't fall under that category, it's not a legitimate interest of government.

> pack.

Geoff-

The reverse-charging problem is caused by normal forward current, once one or more cells have reached zero voltage. Therefore, the series-diode method won't work. You must determine that the total battery voltage has dropped by the amount of one cell's voltage, and stop draining the battery when that occurs. (On the other hand, a parallel schotky diode might help?)

A problem with the idea of replacing NiCds with the new alkalines, is that it is necessary to recharge the alkalines relatively early, in order to realize the long life they are claimed to have. By not recharging until they reach zero volts, the number of times they can be recharged is reduced.

This is opposite of NiCds, which maintain a longer charge-life, when you don't recharge until they are nearly exhausted.

60. Re: TOYOTAS AND MOBILE RIGS

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-03 14:24:41 UTC
From: "kevin.jessup" <kevin.jessup@mixcom.mixcom.com>
Message-ID: <1994Jan3.142441.22655@mixcom.mixcom.com>
Source record: 272611

I wrote to Toyota Customer Service in California and they sent me
a "technical application note" (that's what the local dealer called it)
that was specifically written for radio amateurs.

It was a tiny one-page document with very little of anything technical.
Mostly a politically-correct disclaimer stating that Toyota does not want
to ignore the importance of the amateur radio community. They then go on
to say (in effect): tough shit boys, your on your own! They state that
all warranties are basically void if you use anything with more power than
a CB and that if you DO choose to install an amateur radio, it should
be done by an authorized Toyota service facility!! Like they know any-
thing about it! There were no comments as to the warranties then being
good if Toyota installed the rig. Big surprise. ;-)

They did give some obvious (to radio amateurs) advice...

Keep all feed lines at least 10 inches away from any automotive wiring.

If you must cross over automotive wiring, do so at a right-angle.

Mount the antenna at the rear of the car or on the roof.

Run the radios 12VDC supply cable directly to the battery terminals.
(Fuse the cable at the battery terminals.) Do NOT use any of the
existing electrical system.

I own a 1991 Toyota Tercel. The Engine Control Unit (ECU) is directly
behind the AM/FM Radio/Cassette behind the center console. So much
for mounting the radio up front! :-(The best bet is to get a radio
with a remote head and mount the main unit in the trunk and the
antenna using a mag-mount or trunk-lip mount.

Note: I got the same impression regarding Honda and Ford/Mazda when I
enquired with the service manager. They did not know of any available
"application notes".

Regardless of the make of the car, I think if you keep all the
electronics in the rear of the car, you should be OK.

One final anecdote..

A fellow radio amateur has a late-model Ford pick-up. He has a Yaesu
FT5200 (with the remote head) mounted in the rear of the truck (he
has a cap on the back). The antenna is on the roof above the cab.
He says that at high-way speeds, he notices that the truck looses
speed and runs very rough when he transmits at 50 Watts!

From what I remember, a Rubidium clock has better short term accuracy than a Cesium clock. The Cesium one is more accurate in the long term. So a Rubidium clock that is compared with a cesium one, say using phase comparison with wwvb, is as accurate as these clocks get - about 1 part in 10^12.

From: wa2ise@netcom.com
Message-ID: <wa2iseCJ29Kt.132@netcom.com>
Source record: 272615

From what I have heard from people in the broadcast TV industry, they no longer use the rubidium(sp) or cisium(sp) atomic clocks for a master system clock. Nowdays, your local TV station passes the network feed thru a frame synchronizer (a box that stores and delays the incomming signal a fraction of a frame, that fraction determined by the phase relationship of the TV station's house sync and the network sync. So, nowdays, the frequency of the local TV station's colorburst is just a crystal in a (probably) Tektronix 1910 generator.

Better use WWV.

We're using those on our ambulances for both the cellphone and the 800 MHz
trunk radio; in addition to the pluses Brian mentions, it doesn't get caught
in overhanging tree branches and pulled off of the roof.

Check the prices for Ramsey kits. Not too many out there for $15. In fact, many of the kits cost little less than an assembled radio.

Have you ever used a TigerTronics packet modem? Mine did not work with my computer's original COM port because it was driving an RS232 port with TTL levels. It was also terribly sensitive to rfi from the computer and eventually glitched and burned out the RS232 driver chip on my COM port. The packet modem that I homebrewed far outperforms my old TigerTronics.

> Ramsey Kits (and others) are for the entertainment value of playing

This is an attitude that will turn hams into appliance operators PDQ. Building kits is not supposed to be just entertainment but should also teach some electronics. There is no reason why they should work poorly.

> and built them myself. They worked. Some of them worked pretty good. None
> of them was a direct replacement for a expensive commercial product.

First of all, Jeff, you are older than I am. Yet, most of the contacts that I used for DXCC were with Heathkits. Sure, they were no Collins S-line but they outperformed other ham gear that cost twice as much. The Heathkits, in general, were fine radios and had the added benefit of teaching some electronics, too.

> If you're buying a Ramsey kit to play with, fine. Beats hacking around
> inside an expensive radio. If you're buying a kit to substitute for an
> expensive radio, you get what you pay for.

No one is asking for kits like Ramsey's to be the top of the line.
However, it is not too much to expect that the design be viable and the
proper parts be there. Stories that I have heard include basic design
flaws, missing parts, and lousy customer service.

One of the raisons d'etre of ham radio is to help train technically
competent people. Attitudes like this and kits like Ramsey's, that
discourage potential kit builders, are contrary to this. How can you argue
that ham radio should exist as you keep chipping away at its basic
premises?

: > that you are tuned to a network-supplied program.

: Is this still true?

: I have no direct knowledge, but... many years ago (mid-70's if I remember
: right) one of the hobby electronics mags (I think it was Radio-Electronics) had
: an article for a frequency standard derived from a color tv. Soon afterward a
: letter appeared in the letter column (where else :-), written by an engineer at
: one of the better-equipped stations in L.A. He stated that even network-
: supplied programs taken from a live feed usually go through a time-base
: corrector at the local station, and that this breaks the "chain of
: traceability" back to the network's precision frequency standard.

: (of course, anything that the local taped from a satellite feed for broadcast
: later is completely divorced from any standards at the network.)

: Also, at that time it was stated that the networks used rubidium-clock
: frequency standards, which are secondary standards: They're awfully good but
: they still have to be calibrated against something better. NIST (the folks who
: run WWV) uses cesium-beam clocks, which are primary standards, needing no
: calibration for frequency. Have the networks since upgraded to cesium-beam
: clocks? And, given that the local stations probably haven't, does it matter
: anyway? Even if they have, they're still "only" as good as NIST's clocks, so
: why should one over-the-air signal be better than another? (propagation
: changes on shortwave, maybe?)

I received E-Mail from larson@net.com (reply bounced) stating pretty much
the same thing you stated above. He mentioned things like TBC/frame synch.
processors in the loop *and* the effect of doppler from satellite.
If this is the case, I doubt it matters whether we are talking rubidium or
cesium-beam; the color burst on a network program would be traceable to
an inexpensive quartz reference at the local TV station.

The article in Radio Electronics appeared 3-5 years ago, if I remember
correctly.

Correct. TV stations are not locked to atomic time.

Rajiv AA9CH writes:

> part in 10^12.

A really *good* Rubidium clock like the HP 5065 *does* have better short term stability (1 to 100 seconds averaging time) than even the best Cesium standard (the HP5071). However, it will drift about a part in 1E11 per month. On the other hand, low cost "mini" Rubidium standards do not have such great short term stability and they may drift a part in 1E10 or more per month. The accuracy of a Rubidium depends on when was the last time it was calibrated against a Cesium standard or GPS.

People who want even better short term stability (like JPL) use a Hydrogen maser locked to a Cesium. H Masers have 100's of times better short term stability than the best Rubidium, but they have long term drift due to the teflon container aging.

By the way, there is no requirement for the colorburst frequency to have extremely high absolute accuracy. It is merely necessary for it to have exactly the right *ratio* to the sound carrier to avoid interference. The fact that they couldn't move the frequency of the sound carrier (because of the backward compatibility requirement) is why the field rate had to be lowered by .1%. (The color burst also must have a certain ratio to the field rate, as was previously stated).

The network rubidium clocks never had anything to do with this problem. They were used to allow switching between feeds without a *phase* jump. They could have run the whole network 1PPM high, for example, without a problem, as long as the whole network was the same.

Yes, it definitely is a cellular aerial. I have found them in the Maplin
Electronics catalogue (UK). Height 40mm, freq range 800-1000MHz, so it is
a broadband quarter wave antenna.

Also, according to this catalogue, the longer aerials (9-10") with the funny
coil at the bottom provide an extra 4dB gain over the quarter wave ones.

Boy am I upset.. had my first bad experience with a ham company.

I purchased the Cmos superkeyer II from R&R associates. Had it working and then put it away. took it out about 3 weeks later for a contest. The keyer went crazy. I checked the circuit.. nothing wrong.. finally got the chip out of my Idiom Press version and stuck it in the circuit..worked fine.. seemed it was definetly the chip.

Wrote a long letter and sent the chip back to R&R. Dick had chip for a long time. .got it back today.. he told me to send it back to Bud Southard.. no address or anything.. told me to check for a bad soldering joint.. also gave me the address of Innovative Electronics and told me to deal with them .. because that is where he gets the chips from..

I bought the kit from R&R.. think they should have done something.

Anyone have a phone # for R&R or know who Bud Southard is.

I think this Dick, is definelty a real .....

71. QST, JAN.94 P.9 "IT SEEMS TO US ..." K1ZZ COLUMN

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-03 18:39:09 UTC
From: wr1r@anomaly.sbs.com
Message-ID: <2g9ood$qgj@paperboy.ids.net>
Source record: 272621
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy

From the latest issue of QST:

PART ONE (1):
INSTANT LICENSING
Every radio amateur has had to endure a period of anxious , watchful waiting aft
er taking an examination .
ter taking an examination. just as the watched pot never boils, the watched
mailbox never disgorges the desired news from gettysburg. when WILL that
license finally arrive? for a new enthusiast it can never be soon enough.

Last summer, licensing delays got pretty bad. for awhile it was taking three
months or more from the time an exam was passed untill the license hit the
mailbox [although at this writing, the turnaround time is down to about six
weeks]. No one thinks such long delays are acceptable.

Heres how the process works. Typically, local teams of the volunteer
examiners return the exam results to the volunteer examiner coordinator [vec]
in just a couple of days. The vec's are obligated to turn the sessions
around in 10 days, and usually take a lot less time than that. The ARRL/VEC
then uses overnight delivery to get the session results to the FCC's processors
in gettysburg. There ,work tends to back up because of limited staff and an
obsolete computer system.

Delay begets delay. when the licenses dont cone after a resonable time,
applicants want to make sure their paperwork hasn't been lost, or held up
because they filled something out wrong. So, they get on the phone th the VEC
and the FCC. you can't blame them for wanting to know, but this pulls people
away from processing and adds even further to the backlog.
There has to be a better way.

In November , the fcc proposed what it apparently thought was a better way.
The scheme ,as outlined in a Notice of Proposed Rule Making in PR Docket93-267,
is to grant temporary operating authority for up to 120 days t o anyone who
has earned a Certificate of Successful Completion of Examination [CSCE] by
passing the examination elements required for a license. Those with a history
of non compliance with FCC Amateur Radio Service rules would be ineligible,
and the temporary authorary could be modified or cancelled at any time.

The timing of the Commission's proposal was a bit curious, because the problem
already was being addressed in another way . In October 1992, in Public Law
102-538, Congress authorized the FCC to implement electronic filing of
applications by allowing them to be signed "in any manner or form including
by electronic means, as the Commission may prscribe by regulation." In April
1993, the Fcc adopted the necessary amendments to its Private Radio Service
rules; at the time it noted that the amateur rules, Part97, required no

amendment because there are no specific provisions regarding signatures in Part 97.

Now,more than a year after Congress acted, new eletronic filing procedures still remaim to be implemented . At the time the Commission said, "Electronic filing will expedite the licensing process by eliminating the need for manual entry of application data into the Commission's data base .
PLEASE LOOK FOR THE SECOND PART OF THIS MESSAGE . TNXS
SUBJECT: QST, JAN.94, P9 "IT SEEMS TO US...." K1ZZ COLUMN.

PART TWO (2).

INSTANT LICENSING:

THE ARRL AND OTHER VECs HAVE EMPHASIZED A WILLINGNESS TO SUBMIT APPLICATIONS ELECTRONICALLY, THUS ELIMINATING THE DELAYS AT GETTYSBURG THAT RESULT FROM EVERYTHING HAVING TO WAIT TO BE ENTERED MANUALLY. OUR BUDGET PLANNING INCLUDES ADEQUATE PROVISIONS FOR IMPLEMENTING ELECTRONIC FILING AS SOON AS THE FCC GIVES US THE GO-AHEAD. COUPLED WITH A NEW COMPUTER SYSTEM THE COMMISSION IS ALREADY WORKING ON, THIS SHOULD RESULT IN TYPICAL TURN-AROUND TIMES DROPPING TO JUST A COUPLE OF WEEKS - A DRAMATIC IMPROVEMENT OVER PAST AND PRESENT PERFORMANCE.

JUDGING FROM THE COMMENTS WE'RE HEARING, THE AMATEUR COMMUNITY THINKS THIS WOULD BE SUFFICIENT AND IS UNPERSUADED THAT THE ADDITIONAL ADVANTAGES TO BE GAINED FROM "INSTANT LICENSING" OUTWEIGH THE RISKS.

MOSTLY, THE CONCERNS ARE WITH THE PROPOSED SYSTEM FOR ON-THE-AIR IDENTIFICATION. THE CALL SIGNS BEING PROPOSED WOULD NOT IN ALL CASES CONFORM TO THE ITU REGULATIONS; AN EVEN BIGGER PROBLEM, HOWEVER, IS THAT THEY WOULD BE SELF-ASSIGNED, WITH NO MEANS FOR LOCAL AMATEURS TO CHECK ON THE VALIDITY OF A SUSPICIOUS OPERATOR. IN ITS NOTICE, THE COMMISSION DOESN'T EVEN DISCUSS THE NEED FOR SAFEGUARDS AGAINST SUCH ABUSE. ALSO PUZZLING IS THAT THE COMMISSION DETERMINED JUST A FEW YEARS AGO THAT IT LACKED THE AUTHORITY TO IMPLEMENT A SIMILAR TEMPORARY-LICENSING PROPOSAL; THE BASIS FOR ITS NOW HAVING COME TO THE OPPOSITE CONCLUSION IS UNKNOWN, EVEN THOUGH THE LEAGUE RAISED THE POINT AT AN EARLIER STAGE IN THE PROCEEDING.

IF YOU ARE AMONG THE MANY WHO HAVE MISGIVINGS ABOUT THE PROPOSAL, REST ASSURED THAT THE ARRL BOARD SHARES YOUR CONCERNS. THE LEAGUE IS ON RECORD AS FAVORING AN EARLY IMPLEMENTATION OF ELECTRONIC FILING AS A BETTER WAY OF GETTING NEW AMATEURS ON THE AIR FASTER. WHETHER YOU AGREE OR NOT, FEEL FREE TO SHARE YOUR THOUGHTS BY WRITING YOUR ELECTED ARRL DIRECTOR; THEY HOLD THE OFFICE BECAUSE THEY'RE INTERESTED IN YOUR OPINION. YOU MAY ALSO WANT TO LET THE FCC KNOW WHAT YOU THINK. FRANKLY, BECAUSE THE COMMISSION WENT AHEAD AND PROPOSED SOMETHING WE'D ALREADY TOLD THEM WAS FLAWED, WE WOULDN'T MIND A BIT (AND IT MIGHT BE VERY USEFUL) IF YOU WOULD JUST TELL THEM YOU SUPPORT THE ARRL POSITION ON PR DOCKET 93-267, AND THAT THEY SHOULD GET MOVING ON ELECTRONIC FILING INSTEAD.

SEND AN ORIGINAL AND FOUR COPIES OF YOUR COMMENTS TO THE SECRETARY, FCC, WASHINGTON,DC, 20554. AT THE TOP PUT "IN THE MATTER OF PR DOCKET 93-267."

MAKE SURE YOUR COMMENTS ARRIVE BY JANUARY 10,1994. WE AND YOUR DIRECTOR, WOULD BE PLEASED IF YOU'D FAVOR US WITH A COPY.- DAVID SUMMER, K1ZZ
========== END==========END==========
PARTS ONE (1) AND TWO (2) RETYPED FROM JANUARY 1994 QST. PAGE 9.
"IT SEEMS TO US..." COLUMN REGARDING INSTANT LICENSING.
==========
DECEMBER 27, 1993

MR. SUMNER;

I AM WRITING TO YOU IN REGARDS TO YOUR MOST RECENT EDITORIAL IN QST (JAN.94) ON "INSTANT LICENSING". IN THE FIRST PARAGRAPH YOU EXPLAINED THE JORRORS OF HAVING TO "ENDURE A PERIOD OF ANXIOUS, WATCHFUL WAITING AFTER TAKING THE EXAMINATION" AND HOW "FOR THE NEW ENTHUSIAST, IT CAN NEVER BE SOON ENOUGH."

YES, I CAN ENPATHIZE WITH THE NEW ENTHUSIAST, BUT WHY DOES YOUR EDITORIAL START IN A MOOD OF DOOM AND GLOOM ? WHY DO YOU FAIL TO POINT OUT THE POSTIVE ASPECTS OF HAVING TO WAIT REGARDLESS OF THE ACTUAL TIME, BE IT 12 WEEKS OR 6 WEEKS ? AGAIN, IF YOUR REFERING TO THE NEW ENTHUSIAST BE IT THE NOVICE OR NO CODE TECH. THIS WOULD BE THE TIME WELL SPENT WITH HIS/HER ELMER, PREHAPS CONSTRUCTING YOUR HF STATION OR THE NEW NO CODER LISTENING AROUND ON THE LOCAL REPEATERS TO SEE "HOW IT'S DONE IN ROME". THIS TIME IS VERY CRITICAL IN MANY WAYS TO BETTER MANNERS AND OPERATING PRACTICES AND PROCEDURES, NOT TO MENTION TECHNOLOGICAL INVESTIGATIONS AND THE LIKE.

WHY DOES THE LEAGUE TAKE A DRAMATIC REVERSAL ON IT'S OPINION RELATED TO LICENSING WAIT TIMES, WHEN IN NOVEMBER 1988 ISSUE OF QST, ON PAGE 43 IN THE ARTICLE "NOVICE NOTES: BEFORE YOUR TICKET ARRIVES", THE OPINION STATED WAS "THE TIME BETWEEN THE NOVICE TEST AND THE ARRIVAL OF YOUR LICENSE CAN BE ONE OF THE MOST VALUABLE TIMES IN YOUR HAM CAREER, IF YOU USE IT WISELY." ? THE ARTICLE GOES ON TO SAY THE HAM IN-WAITING SHOULD DIRECT HIS OR HER EFFORTS TOWARDS CONTINUING THEIR LEARNING PROCESS, CONSTRUCTING THEIR SHACK, AND DECIDING ON WHAT TYPE OF ANTENNAS TO ERECT.

I CAN ALSO SYMPATHIZE WITH THE "LICENSING DELAYS TAKING 3 MONTHS" AS YOU STATED IN THE SECOND PARAGRAPH. ALL I CAN SAY IS THAT WE ALL HAD TO AT ONE TIME OR ANOTHER IN OUR LIVES 'WAIT FOR GOOD THINGS TO COME'. COULD YOU CONCEDE POSSIBLY THAT THE LICENSE ITSELF MAY CARRY MORE VALIDITY AFTER THE INITIAL PERIOD OF WAITING, STATION CONSTRUCTION, AND TRANSMISSION MONORTING?

I KNOW THAT MYSELF AND MANY OTHER HAMS HAD TOP WAIT OFTEN MORE THAN THE AVERAGE 6 WEEK PERIOD. ARE WE ANY WORST OFF TODAY ? I THINK NOT.

PARAGRAPHS 3 AND 4 I COULD ALMOST AGREE WITH, EXCEPT FOR A FEW MINOR POINTS.

YOU STATE THAT "YOU CAN'T BLAME THEM (THE NEW ENTHUSIAST) FOR WANTING TO KNOW" IN REGARDS TO CALLING THE VEC/FCC INQUIRING AS TO THE STATUS OF THEIR LICENSE, AND HOW THIS " PULLS PEOPLE AWAY FROM PROCESSING AND ADDS FURTHER TO THE BACK-LOG WHERE THE WORK TENDS TO BACK UP BECAUSE OF LIMITED STAFF AND AN OBSOLETE COMPUTER SYSTEM.

WHAT IS SO PREPLEXING TO ME IS THAT THERE ARE MANY WAYS TO REMEDY THIS PROBLEM, SUCH AS CUTTING THE VEC FILING DAYS FROM 10 TO 5, AND PREHAPS HAVE THE VEC MAIL A CARD TO LICENSE APPLICANT AT THE SAME TIME HIS/HER PAPER WORK IS MAILED TO THE FCC, THUS THE APPLICANT "KNOWS" THAT HIS/HER PAPER WORK HASN'T BEEN "LOST", AND IS JUST FLOUNDERING THRU THE NORMAL US GOVERMENT BUREAUCRATIC PROCESSING ENGINE.

I HAVE ALWAYS FOUND THE PROCESSING DELAYS TO BE WITH THE INEFFICIENT VEC SYSTEM, RATHER THAN THE FCC ITSELF. FOR INSTANCE, IN MAY 1993, A FRIENDS WIFE TOOK HER NOVICE EXAM ON MAY 21ST. AND HER PAPER WORK WAS MAILED TO THE FCC IN GETTYSBURG ON MAY 27TH. ON JUNE 23RD. SHE HAD HER LICENSE, PROCESSED AND DATED BY THE FCC IN MID-JUNE. A "TOTAL" PROCESSING TIME OF LESS THAN 4 WEEKS, FROM MAILBOX TO MAILBOX. SO, ONE YOU SPEAK OF 6 OR 12 WEEK DELAYS, OBVIOUSLY THEY ARE CAUSED BY AN INEFFICENT VEC SYSTEM. PREHAPS THE LEAGUE SHOULD ATTEMPT TO REVAMP THE VEC SYSTEM SO THAT THE TURN-AROUND TIME IS BETTER.

EVEN IF THE BACK LOG IS AT THE FCC, ISN'T THE PROBLEM BETTER ADDRESED BY HIRING AN ADDITIONAL STAFFER ? AND, AS YOU YOURSELF KNOW, PUT THE NEW COMPUTER SYSTEM THE FCC IS WORKING ON, ON LINE. IN FACT, IF THIS NEW COMPUTER SYSTEM IS GOING TO BE UP AND RUNNING THAN AS YOU STATE "THIS SHOULD RESULT IN TYPICAL TURN AROUND TIMES DROPPING TO JUST A COUPLE OF WEEKS-A DRAMATIC IMPROVMENT OVER PAST AND PRESENT PREFORMANCE" THEN I CAN'T EVEN UNDERSTAND WHY THE BIG CONCERN OVER HOW LONG IT TAKES FOR A TICKET TO ARRIVE.

I AM FAR MORE DISTURBED AND ALARMED AT THE NEXT FEW PARAGARAPHS WHERE YOU ACKNOWLEDGE THAT YOU ARE AWARE OF THE MAJORITY IN "THE HAM COMMUNITY THINKS THIS WOULD BE SUFFICI-ENT AND IS UNDERSTANDING THAT THE ADDITIONAL ADVANTAGES TO BE GAINED FROM INSTANT LICENSING OUTWEIGHS THE RISKS." HOWEVER, IN RETROSPECT, I CAN RECALL WHEN THE LEAGUE KNEW THAT THE MAJORITY OF MEMBERS DID NOT WANT THE NO CODE LICENSE PLAN (25 TO 1, ACCORDING TO "HAPPENINMGS: NO CODE REPLY COMMENTS , ARRL", QST, OCTOBER 1983, PG.58), AND THE LEAUGE TOOK A POSTION OF "NO CODE! NO WAY!"(QST, SEPTEMBER 1983, PG.61). NOW, FOR THE "BETTERMENT" OF THE HOBBY, WE HAVE A NO CODE LICENSE, SUPPORTED BY THE ARRL, IN DRASTIC CONTRAST TO WHAT IT'S OWN MEMBERS CLEARLY WANTED.

TOWARD THE END OF THE ARTICLE YOU STATED THAT THE FCC "IN IT'S NOTICE DOESN'T EVEN DISCUSS THE NEED FOR SAFEGUARDS AGAINST ABUSE". I WOULD SAY IF THE LEAUGE IS WELL AWARE OF THE "LACK OF SAFE GUARDS AGAINST ABUSE" AND MORE TO THE POINT, THE FACT THAT THE FCC "DOES'NT EVEN DISCUSS THE ISSUE OF SUCH SAFE GUARDS" THAT THIS IS THE PLACE TO START INSTEAD OF ASKING LEAUGE MEMBERS TO SUPPORT PR DOCKET 93-267(ASKING THE FCC"TO GET MOVING ON ELECTRONIC FILING"). LET'S NOT PUT THE CART (ELECTRONIC FILING) BEFORE THE HORSE (ENFORCEMENT) AND STOP WORRING ABOUT HOW FAST SOME ONE CAN BE GRADIFIED WITH AN INSTANT OR "QUICKY" LICENSE, BUT RATHER WITH THE PRESERVATION OF THE REPUTATION OF THE AMATEUR SERVICE.

LAST BUT NOT LEAST I WOULD LIKE A LOT MORE ASSURANCE ON THIS ISSUE THAN "REST ASSURED THAT THE ARRL BOARD SHARES YOUR CONCERNS". GIVEN THE TRACK RECORD AND 180 DEGREES TURNAROUND ON THE ISSUE OF THE NO CODE LICENSE FROM YOUR OWN EDITORIAL "NO TIME FOR NO CODE" (QST,NOVEMBER 1982,PG.9) TO "CODLESS LICENSE...THE TIME HAS COME" (QST,SEPTEMBER 1989,PG9) THAT YOU ALSO PENNED, I THINK A MORE DEFINITIVE STATMENT FROM THE LEAGUE SHOULD BE FORTH COMING.

DON'T MISUNDERSTAND ME, I AM GLAD THE LEAGUE IS IN FAVOR OF ELECTRONIC FILING. THAT'S FINE, BUT THE LEAGUE NEEDS TO UNEQUIVOCALLY STATE IN PRINT THAT IT IS ****NOT**** IN FAVOR OF ANY INSTANT LICENSING PLAN. WE HAVE WITNESSED WHAT THE NO CODE HAS DONE FOR THE HOBBY AS WELL AS TO THE NOVICE AND ELMER PART OF THE LICENSING STRUCTURE. LET'S NOT OPEN A PANDORA'S BOX OF PROBLEMS WITH INSTANT LICENSING.

SINCERELY,
FRANK ALMEIDA III/ WR1R

P.S.: BY THE WAY I FIND IT IRONIC THAT YOUR ARTICLE SPEAKS ABOUT INSTANT LICENSING AND ON PG.52 OF JANUARY 94 QST. IN THE ARTICLE "WHERE ARE THE NOVICES" I QUOTE "THE JULY 1993 EDITORIAL ARRL EXECUTIVE VICE PRESIDENT DAVE SUMNER, K1ZZ, OPENED A CAN OF WORMS BY PENNING "WHERE ARE THE NOVICES?"

I CAN TELL YOU WHERE THEY WENT.......THEY FOLLOWED THEIR ELMER.......AND GOT ON THE........NO CODE EXPRESS....73'S

>it can't be too efficient but vertical design and lack of radials can
>somewhat compensate for reduced size. I just don't know how much.
>Ignacy Misztal, NO9E

I purchased the MFJ vertical several months ago. The bandwidth on 40M
is fairly narrow as one would immagine so a tuner will help. Without the
tuner you will get about 40KHz. The antenna performance was disappointing.
I was able to do an A/B comparision with a dipole and they are comparable
except that the MFJ (being a vertical) has alot more noise. I encountered
another problem with the MFJ in that the SWR on 20M goes through the roof
whenever it rains. I called MFJ about this and they said they are aware of
the problem and have since sent me some little plastic end caps for the
loading coils...whether this will solve the problem or not...I don't know.
If I were you I would suggest you may want to look at the Cushcraft R5 or
R7 (for 40M). I havn't tried these but they should be considered. If you
really want the MFJ...I have one for sale :)

Hi Gang,

I hope I'm posting in the right area. I'm currently waiting for the FCC to issue my license. I'm using this waiting period to decide on my first rig. When I started studying for my ticket, I thought I would start out on the HF bands. However, during the course of my studies, satellite communications sounded really appealing. And of course, there is the local 2m and 70 cm FM traffic as well.

I am looking for those satellite operators who would like to recommend radio/antenna combinations for working the satellites. I'm am currently leaning more towards the VHF bands for my first radio, mainly due to the sizes of the antennas. (Which is sort of ironic considering I decided to get my amateur license to DX on the HF bands). From what I can tell, you can't use a dual band FM transceiver to work most of the satellites because they require SSB and CW modes. Any recommendations concerning equipment necessary for sat work would be greatly appreciated.

I'm not sure i'll be running any packet radio. I work on data communications software all day, and I'd like my hobby to revolve around something else. I have two locations I'll be operating from, my home in a very urban setting, and our cabin in a very rural setting. My guess is I'll run most of my HF traffic at the cabin where I can put up a fairly good sized antenna farm and no one will care considering the remoteness of the property, and run the VHF traffic back home in the city. Sound reasonable?

I realize that amateur radio has a wide range of interests and opportunities. Right now I'm interrested in HF, 2m FM repeater, and satellite. Although I have a good sized budget, it looks as though I can't get into HF and satellite right away. Any opions as to which would be better to start out in would be greatly appreciated.

In article <1994Jan5.125300.21517@mnemosyne.cs.du.edu> jmaynard@nyx10.cs.du.edu (Jay Maynard) writes:
>It's real simple: lat/lon/haat information is enough to walk up to the tower
>or building the repeater is on, and therefore enough to get the repeater
>stolen, or for someone to talk to the site owner and get the repeater kicked
>off of the site. Sites are very, very hard to get unless you're willing to pay

Giving lat/long without HAAT in degrees and minutes (without seconds) would enable travelers to use the information while not allowing thieves/vandals/disgruntled persons from causing trouble; degrees and minutes are just enough to locate something within an area somewhat over a square mile, useful for those with good intent and as useless as the current repeater directories for those with malicious intent. (A minute of latitude is about 6080 feet and change; slightly less, I think, for a minute of longitude.)
I don't know about you, but I would find it no easier to precisely locate a repeater by lat/long than by approximate town; a traveler would, however, find it easier to locate nearby repeaters.
You mention Texas; I pulled out the repeater directory and the atlas and looked for the first two repeaters in "North Texas", in Alto and Archer City. They're about 240 air miles apart. If I'd just passed out of range of the Texarkana repeater(s), I'm sure I couldn't hit either one from my car. If I had lat/long info, though, I could bypass them quickly and find a repeater I _could_ hit (or know there were no likely candidates) without an extensive map search. But I'd bet a vandal wouldn't find it difficult to locate the repeater in Archer City quickly, even without lat/long to help.
HAAT, on the other hand, provides clues that might be better left unpublished...

>honestly, my ulterior motive is in the construction of a
>cool-chamber in which to store my homebrew beers!! As a ham with a

Unfortunately, it's been enough years that I couldn't tell you where to
look for information.
There's a commercial unit for cars for this purpose; last I saw it it
was about $129.95. Last I investigated making my own, it would have
cost me about $300 for the Peltier devices alone.
Peltier junction devices are quite expensive and probably not a good
choice for this. Get a small refrigerator instead.

NOTE: The Effective Sunspot Number for 05 JAN 94 was 63.7.
The Full Kp Indices for 05 JAN 94 are: 1o 1o 1+ 2- 2o 2- 1o 2o

SYNOPSIS OF ACTIVITY

Solar activity was low. Region 7646 (S08W39) generated
the majority of the days C-class flares, accounting for six.
The largest flare of the day was an optically uncorrelated C6
with an associated Type II radio sweep at 06/0619Z. A new
Region was assigned: Region 7650 (N04E41).

Solar activity forecast: solar activity is expected to be
low to moderate.

The geomagnetic field has been at quiet to unsettled
levels for the past 24 hours.

Geophysical activity forecast: the geomagnetic field is
expected to be unsettled due to numerous small flares.

Event probabilities 07 jan-09 jan

Class M 50/50/50
Class X 05/05/05
Proton 05/05/05
PCAF Yellow

Geomagnetic activity probabilities 07 jan-09 jan

A. Middle Latitudes
Active 20/20/20
Minor Storm 10/10/10
Major-Severe Storm 01/01/01

B. High Latitudes
Active 20/20/20
Minor Storm 10/10/10
Major-Severe Storm 01/01/01

HF propagation conditions were near-normal over all
regions. Minor signal degradation may be sporadically observed
on high-latitude circuits over the next several days, but
particularly on 08 January. Otherwise, near-normal conditions
should persist throughout the next 72 hours.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

Good morning. It's Sunday the 9th of January and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- RSGB Member, Professor Les Barclay receives an OBE; Last chance to attend the Presidential Installation of Ian Suart, GM4AUP, in Glasgow; UHF Repeater stolen from site; New RLOs for Bedfordshire, Hereford and Worcester.

Congratulations to RSGB Member Professor Les W Barclay, G3HTF, who received an OBE in the 1994 New Years Honours list in recognition of his work in the field of propagation. Professor Barclay is a member of the Propagation Studies Group.

The RSGB's 1994 President will be officially installed at an evening reception and dinner in Glasgow next Saturday the 15th of January. Any RSGB member wishing to attend should contact Belinda Gannon at RSGB headquarters without delay.

The UHF Repeater GB3GF, operated by the Guildford UHF Repeater Group was completely stripped and stolen from its site at Guildford, Surrey sometime between 0030 and 0815UTC on Thursday the 30th of December. The whole installation was neatly and skilfully dismantled with tools during its time of least usage, and a fifty foot high tower was scaled on a wet night to remove the antennas. Most of the items removed have GB3GF stamped on them. The repeater is crystal controlled for receive on 433.300MHz and for transmit on 434.900MHz. Also the transmitter automatically identifies in Morse code with GB3GF every 15 minutes. Anyone who is offered for sale or modification a Pye F9U a wall-mounted base station, Cavity filter tubes (a home brew copper and brass item), a Pye AE450F cavity filter, a Hexalator (circular) or comes across any unusual transmissions on RB12, especially if interspersed with GB3GF identification in Morse, is asked to please contact immediately PC 1284 Clarke at Guildford Police on 0483 31111 extension 3128.

{Newsreaders: This item can be deleted if your broadcast does not cover the Bedfordshire, Hereford and Worcester or Northumberland areas}

Attention RSGB members in Bedfordshire and Hereford and Worcester area. Two new RSGB Liaison Officers (RLO) have been appointed, one for each county. The RLO for Bedfordshire is Geoff Linssen, G0PIZ. His address is 401 Dallow Road, Luton, Beds, LU1 1UL and his telephone number is 0582 415576. For Hereford and Worcester, the RLO is John Marks, G0OWT. His address is 61 Sebright Road, Wolvesley, Kidderminster, Worcs DY11 5UA and his telephone number is 0562 850061.

Next attention RSGB Members in Northumberland. The RSGB Liaison Officer (RLO) for Northumberland is Jack Swayne, G3BLE and his address is 12 The Haven, Beadnell, Chathill, Northumberland, NE67 5AW. His fax or telephone number is 0665 720601. RLOs hold a wide range of information and they are available to help any RSGB member seeking advice.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Ogasawara, JD1AMA will be active today, Sunday the 9th, during the Japanese International CW LF Contest looking for European contacts from 1900 - 2200 UTC. See January RadCom, page 19 for further details. From Madagascar, JE8XRF will sign 5R8DM from now until Sunday the 16th of January. Operation will be on 10 - 80 metres mainly SSB with some CW, plus 160m if possible. From Aruba, NW1J, W1HL and AA1M will sign P4/W1EKT from tomorrow, Monday the 10th until Monday the 17th of January on all bands 10 - 160 metres using CW, SSB and RTTY. And from Bahrain, ex ZC4DG is now active as A92FV for the next four months on all bands using CW. He may also use A92C the club station callsign.

Rally news:

We have no rally news for you this week as the next event notified to us is not until Sunday the 23rd of January 1994.

However, here are some dates for your diary:

The 1994 RSGB VHF Convention is to be held at its usual venue at Sandown Race Course in Surrey on Sunday the 20th of February. See January's RadCom page 24 for full details of the comprehensive lecture programme.

The 1994 RSGB London Amateur Radio and Computer Show is to be held during Saturday the 12th and Sunday the 13th of March, at the Lee Valley Leisure Centre, (formerly Picketts Lock), Picketts Lock Lane, Edmonton, London. Full details of the comprehensive lecture programme will appear in February's RadCom.

HF contest news now:

The RSGB AFS Team CW Contest takes place today, Sunday the 9th from 1300 - 1700 UTC on 3.510 - 3.590MHz, with the 3.570 - 3.590MHz reserved for slower-speed contacts (the QRS Corral). See November RadCom page 84 for further details. The RSGB LF Cumulative 1.8MHz Contest takes place next Tuesday the 11th of January from 2000 - 2200UTC. The RSGB AFS Team SSB Contest takes place next Saturday the 15th of January from 1300 - 1700UTC on 3.600 - 3.750MHz. See November RadCom page 84 for further details. The RSGB LF Cumulative 7.0MHz Contest takes place next Sunday the 16th of January from 1000 - 1200UTC, followed by the LF Cumulative 3.5MHz Contest from 1600 - 1800 UTC. See December's RadCom, page 84, for detailed information on all the LF Cumulative Contests. Also the HA DX CW Contest and the AGCW-DL QRP Contest are scheduled for next weekend, Saturday the 15th and Sunday the 16th of January.

Next some VHF contest news:

The RSGB 144MHz CW Single Operator Fixed & All Others Contest takes place next Sunday the 16th of January, from 1000 to 1600 UTC. There are three sections:-

Fixed station single operator, Open and Listeners. The first RSGB 70MHz Cumulatives Contest takes place on Sunday the 23rd of January from 1000 - 1200UTC. See December's RadCom, page 83 for details for both the VHF events.

And now the solar factual data:

Due to the holidays, we have an extended period covering the 17th to the 26th of December. We will catch up with the rest next week. Solar activity was reasonably quiet up to the 22nd when a series of M flares erupted lasting through to the 26th. They ranged from an M1.1/1N up to M1.5/1N and it was the most active period since last June. The sunspot indices rose every day from 26 on the 17th up to 131 by the 25th and gave a mean of about 69. Not surprisingly solar flux levels also rose from 84 on the 17th up to 125 by the 26th and averaged 100 for the period. The geomagnetic activity started very disturbed with Ap indices up to 25 units on the 18th but slowly declined to just unsettled levels of 12 by the 26th, giving an average of 13.5 units. The state has been warnings of high latitude magnetic storms due to the flare activity, and of a massive stratwarm over Siberia with temperature increases of 40 degrees centigrade at the 10HPA level. The radio quality indices have improved every day, from below normal up to the 21st and were just above normal by the 26th. The aa indices for the 14th to the 27th December have been just unsettled and the daily indices averaged 22.4 nanoTeslas about K3, with little variation day to day. The X-Ray flux has increased considerably from A8.2 on the 19th up to B5.9 by the 25th, the highest level since last June. The period averaged B2.8 units. The 10 and 6 meter bands have been very active with widespread sporadic E during the past 2 weeks.

Now the ionospheric data for Central France:

The F2 day-time critical frequencies at Poitiers as reported by Meudon for the period 17th to the 26th of December averaged 7.8MHz. The peak times are now around 10am to mid-day but the highs are not lasting very long, only four or five hours. The darkness hour lows are averaging 2.6MHz and are anywhere between 1800 hours down to 0600 hours. There has been spread F reported on many early mornings lasting up to five hours at times.

Now the ionospheric data for the north:

The F2 day-time critical frequencies at Ekaterinberg have suffered from the high latitude magstorms and averaged only 6.2MHz. The darkness hour lows averaged 2.4MHz.

And lastly the solar forecast:

This week, the quiet side of the sun will be looking our way. Solar flux levels are expected to be about the 95s, with geomagnetic levels possibly being very unsettled from today until the 15th due to the passage of coronal holes. The radio quality indices are expected to be normal, rising to above normal from the 16th. The 90 day smoothed solar flux is 98 units at present.

And that's the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 U I and G7 R N series, and Novice calls in the 2 0 A H and 2 1 C M series. .

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Next, the local news.

NEWS FOR THE SOUTH EAST

Meeting for Monday the 10th of January:

Southdown Amateur Radio Society has its Annual General Meeting at the Chaseley Home for Disabled Ex-Servicemen, Southcliffe, Bolsover Road, Eastbourne. The meeting opens at 7.30pm for an 8 o'clock start. For more details contact Jan, G4XNL, tel: 0323 412699.

Meeting for Tuesday the 11th of January:

Stevenage and District Amateur Radio Society has a talk on 'Converting a DB27 CB Antenna to HF Mobile' by Rob, G2BZK. Contact Neil, 2E1ASZ on 0438 350882 for details.

Meetings for Wednesday the 12th of January:

Bracknell Amateur Radio Club meets for its Annual General Meeting. Details from Steve, G4AUC who is QTHR.

Chesham and District Amateur Radio Society has a technical topic entitled 'PSU Repairs' by G8KBV. Details from Ian, G0RTF on 0494 676391.

Cheshunt and District Amateur Radio Club has an Amateur TV Night by Adrian, G0OJY and John, G3WFM. Details from Roger, G4OAA on 0992 464795.

Dover Radio Club has a presentation of 'Kanga Kits' by G0BPS. For further details telephone 0304 825030.

Worthing and District Amateur Radio Club has a talk entitled 'Reminiscing' by G5CO. Details from G4GPX on 0903 753893.

Meetings for Thursday the 13th of January:

Colchester Radio Amateurs has a talk on 'UFOs and UFOlogy' by Trevor, G7OWC. Further details from Mike, G4YJN on 0206 738189.

Edgware and District Radio Society meets for its Annual General Meeting. Details from Rod, G0SQL, tel: 081 204 1868.

Shefford and District Amateur Radio Society has the G8EMJ Construction Contest. Contact Paul, G1GSN on 0462 700618 for further details.

Southgate Amateur Radio Club has a talk entitled 'An Overview of Cable TV'. Further information from Brian, G0MEE on 081 360 2453.

Vange Amateur Radio Society has a talk entitled 'Guns' by Bob, G3IUC. Contact Doris on 0268 552606 for further information.

Meetings for Friday the 14th of January:

Clifton Amateur Radio Society has a Computer evening. Further details from Keith, G4TJE on 081 859 7630.

Hilderstone Amateur Radio Society has a talk on 'The Novice Examination' by Martin, G0LGE. For further details telephone 0843 869812.

Itchen Valley Amateur Radio Club has a talk on 'Radio Scouting and Gilwell Park GB2GP' by Frank, G6OLK. Scouts and Cubs are welcome. Contact Les, G3ABA 0703 732997 for details.

Maidstone YMCA Amateur Radio Society has a talk entitled 'Computer Usage (Packet/Satellites) instructional evening' and CW as necessary. Contact G0RHO, QTHR for further details.

Meeting for Saturday the 15th of January:

Crystal Palace and District Radio Club has a talk 'QRP (Low Power) Homebuilt Radio Equipment' by Wayne, G0JJQ. Details from Wilf, G3DSC on 081 699 5732.

NEWS FOR SOUTH WEST

Meetings for Monday the 10th of January:

Exeter Amateur Radio Society has a talk on 'Welding Techniques' by Basil Bolt. Details from Ray, G3YBK on 0392 78710.

Wincanton Amateur Radio Club has a talk entitled 'Packet Radio' by G3CQE. Further details from Dave, G3ZXX on 0963 34360.

Meeting for Tuesday the 11th of January:

Salisbury Radio and Electronic Society meets for its Annual General Meeting. Details from David on 0722 330971.

Meeting for Wednesday the 12th of January:

South Bristol Amateur Radio Club has a Table Sale - A bring and sell anything. For more information tel: 0275 834282.

Meeting for Thursday the 13th of November:

Yeovil Amateur Radio Club has a Junk Sale. Contact Cedric, G4JBL on 0258 473845 for further information.

Meeting for Friday the 14th of January:

Shirehampton Amateur Radio Club has a 'Packet Radio Overview/Getting going evening' by G4FRO. For further information contact Ron, G4GTD on 0272 770504.

NEWS FOR EAST ANGLIA

Meeting for Monday the 10th of January:

Felixstowe and District Amateur Radio Society has a Discussion evening. For details contact Paul, G4YQC on 0394 273507 any evening.

Meeting for Wednesday the 12th of January:

Norfolk Amateur Radio Club has a 'Real Radio Evening'. For further details contact Sheila, G0KWP on 0603 618810.

Meeting for Thursday the 13th of January:

Yarmouth Radio Club has a 'Contest Plans for 1994' discussion. Details from Tony, G3NHU, on 0493 721173.

Meeting for Friday the 14th of January:

Cambridge and District Amateur Radio Club has a demonstration of the 'Shacklog' Software by Alan, G3PMR. Contact John, G0TIL on 0763 243570 for details.

NEWS FOR THE MIDLANDS

Meetings for Monday the 10th of January:

Mansfield Amateur Radio Society has a talk by Rob Mannion, G3XFD, Further information from Mary, G0NZA on 0623 755288.

Stratford upon Avon and District Radio Society meets for its New Year Social. Further details from Alan, G0CXJ, tel: 0608 682495.

Meeting for Tuesday the 11th of January:

Loughborough and District Amateur Radio Club has a talk by G8AYG. For further details contact G8SNF by telephoning 0509 218259.

Meetings for Wednesday 12th of January:

Bromsgrove Amateur Radio Society has a talk on 'Antenna Construction'. More information from Barry, G0TPG on 0527 542266.

Derby and District Amateur Radio Society has a Visit by SMC Chesterfield. Contact Hayley, G7PXA on 0773 856904 for further information.

South Birmingham Radio Society has a talk and slide show on 'Holes in the Ground' by a member of the Dudley Canal Trust. For further details contact Roy, G8ACR on 021 474 3784.

Telford and District Amateur Radio Society has a talk entitled 'Tuning Linears' by G8PAW. For further details contact Dave, G4EIX, on 0952 588878.

Meetings for Thursday the 13th of January:

Cannock Chase Amateur Radio Society has a venue and now meets at the Four Crosses Inn, Watling Street, Gailey-Cum-Hatherton. Contact Eric, G4ICE on 0543 502836 for further information.

Amateur Radio Club of Nottingham has a 'Bring your Gear Night'. Contact Simon, G0IEG on 0602 501733 for further details.

Salop Amateur Radio Society meets for an Extraordinary General Meeting, at the Beauchamp Hotel, Shrewsbury at 8pm. Contact G0SST on 0743 361935 for details.

Vale of Evesham Radio Amateurs' Club meets for its Annual General Meeting. The meeting starts at 8pm at the BBC Club, High Street. Details from Alasdair, tel: 0386 41508.

Meetings for Friday the 14th of January:

Bromsgrove and District Amateur Radio Club has a Visit from members of the Stourbridge Amateur Radio Society. Informal visitors welcome. Further details from Joe, G3MRC, tel: 0562 710010.

Spalding and District Amateur Radio Society meets for its Annual General Meeting. Details from G4OO, tel: 0775 750382.

South Notts Amateur Radio Club has a Construction plus HF/VHF On Air evening. For further details contact Julie, G0SOU on 0602 216342.

NEWS FOR THE NORTH OF ENGLAND

Meeting for Monday the 10th of January:

Sheffield Amateur Radio Club meets to prepare for the inter-Club Quiz. Further details from David, G0JJR Tel: 0742 446282.

Meetings for Tuesday the 11th of January:

Bury Radio Society has a talk entitled 'Introduction to Packet Radio' by G3RTU. For further details contact Mike, G4GSY on 061 761 5083.

Fylde Amateur Radio Society meets for its Annual General Meeting. Details from Rob, G7CUL, QTHR.

Liverpool and District Amateur Radio Society has a GX3AHD on the Air evening. Further details from Ian, G4WWX who is QTHR.

Wakefield and District Radio Society meets for a talk on 'Antennas' by David, G0DJA. Further details from Roy, G0TBY on 0924 893321.

Meetings for Wednesday the 12th of January:

Stockport Radio Society has a talk on 'Doublet Antennas' by G0HAL. For details telephone 061 439 4952.

Wirral and District Amateur Radio Club meets for its Annual General Meeting, starting at 8pm at Irby Cricket Club. Contact Paul, G0JZP, on 051 648 5892 for further details.

Meetings for Thursday the 13th of January:

Hambleton Amateur Radio Society has a Practical Night. Further details from Nigel, G0NHM on 0609 776608.

North Wakefield Radio Club meets for its Annual General Meeting. For further information contact John, G4RCG on 0924 362144.

Meetings for Friday the 14th of January:

North Ferriby United Amateur Radio Society has a 'Discussion Evening' with Ken, G4VKK. Further details from Frank, G3YCC, tel: 0482 650410.

South Manchester Radio Club has a talk on 'Baluns' by G0HAL. For further details contact Edward, G7FQY, tel: 061 969 1964.

Stockport Radio Society Computer Group has a talk entitled 'DOS/Batch Files' by G0NKM. For further details telephone 061 439 4952.

NEWS FOR SCOTLAND

Meeting for Tuesday the 11th of January:

Dundee Amateur Radio Club has a Construction Night. Details from GM4FSB who is QTHR.

Meeting for Thursday the 13th of January:

Lerwick Radio Club has a Film Evening with Video Tapes of DX-peditions and other radio related topics. The meeting starts at 7.30pm, in the Islesburgh Community Centre, Kings Harald Street, Lerwick. Details from Robert, GM4CAQ, who is QTHR.

Meeting for Friday the 14th of January:

Aberdeen Amateur Radio Society has its Presidential Address by the newly elected President, Don Travis, at Queen Mothers House starting at 8pm. Details from John, GM1TDU, tel: 0224 706619.

And that's the end of this week's GB2RS news broadcast, which was prepared by the Radio Society of Great Britain.

80. Re: Superpressure balloon info?

Newsgroup: rec.radio.amateur.misc

I am a member of the Edge of Space Sciences balloon group in Denver, CO.

Bill Brown WB8ELK and the payload was in Denver on Tuesday, Jan-4-94.
He said the launch was scheduled for 8:00 am MST on Thursday, Jan-6-84
(delayed from the 10:00 am MST on Jan-5-94 mentioned in the article).

Today is Friday. I haven't heard any more. I would not be surprised if
the launch has been delayed again due to equipment or weather.

| Geomagnetic Field |Fri|Sat|Sun|Mon|Tue|Wed|Thu|Fri|Sat|Sun| Anomaly |
| Conditions | Given in 8-hour UT intervals | Intensity |
|_____________________________________________________________________________|

CONFIDENCE LEVEL: 65%
```

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

60-DAY GRAPHICAL ANALYSIS OF GEOMAGNETIC ACTIVITY

```
------------------------------------------------------------
51 | J |
48 | J |
46 | J |
43 | J |
41 | J |
38 | M J |
36 | MM J |
33 | MM J |
31 | MM J |
28 | MM J |
26 | MM J |
23 | MM J |
20 | AMM J A |
18 | AA AMM J A AAA |

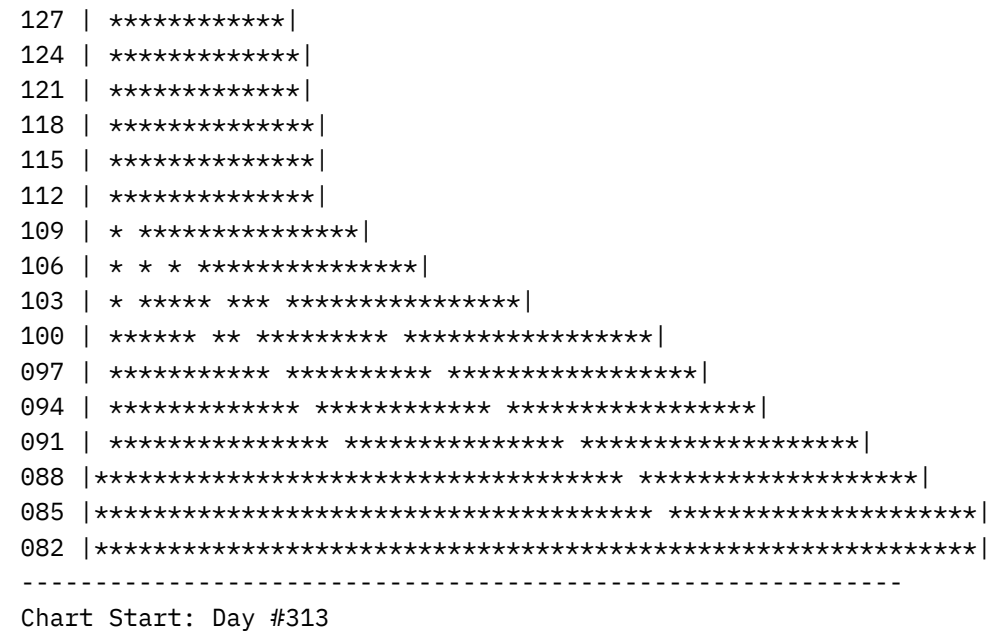
0 |UUQQUUUUQAAUQQQQQUQQUQAMMUUQAJQUUUQQUAAUUUUUUUUUQQQQAAAAUQQU|
------------------------------------------------------------
```

Chart Start Date: Day #313

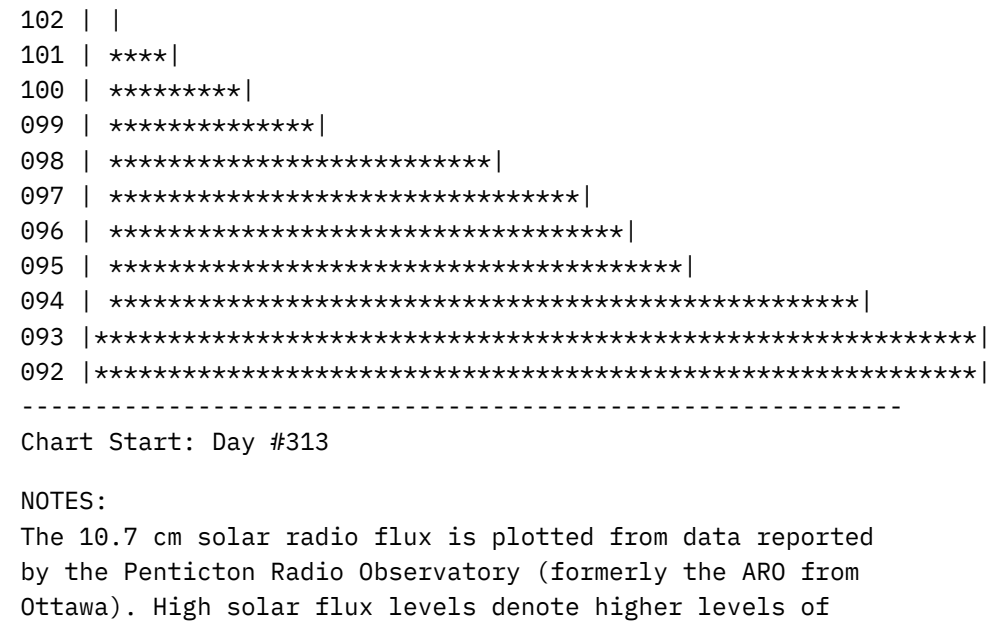
NOTES:
This graph is determined by plotting the greater of either the planetary
A-index or the Boulder A-index. Graph lines are labelled according
to the severity of the activity which occurred on each day. The left-
hand column represents the associated A-Index for that day.
Q = Quiet, U = Unsettled, A = Active, M = Minor Storm,
J = Major Storm, and S = Severe Storm.

CUMULATIVE GRAPHICAL CHART OF THE 10.7 CM SOLAR RADIO FLUX

```
------------------------------------------------------------
151 | |
148 | * |
145 | ** |
142 | * ** |
139 | * ***** |
136 | * ***** * |
133 | ** ****** * |
130 | ** ****** **|
```



GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX



NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

CUMULATIVE GRAPHICAL CHART OF SUNSPOT NUMBERS

```
140 | **|

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts.

NOTE: The Effective Sunspot Number for 06 JAN 94 was 69.1.
The Full Kp Indices for 06 JAN 94 are: 3o 3- 3- 3o 3- 3- 1+ 2+

SYNOPSIS OF ACTIVITY

Solar activity was moderate. Region 7646 (S10W51)
produced an M1/1N flare at 07/0943Z and six C-class bursts.
Other regions on the disk remained stable.

Solar activity forecast: solar activity is expected to be
low to moderate.

The geomagnetic field has been at quiet levels for
the past 24 hours. High latitude stations reported active
conditions from 1200-1500Z.

Geophysical activity forecast: the geomagnetic field is
expected to be unsettled to active due to moderate flare
activity.

Event probabilities 08 jan-10 jan

Class M 30/30/30
Class X 05/05/05
Proton 05/05/05
PCAF Yellow

Geomagnetic activity probabilities 08 jan-10 jan

A. Middle Latitudes
Active 35/15/10
Minor Storm 05/05/05
Major-Severe Storm 01/01/01

B. High Latitudes
Active 35/20/20
Minor Storm 10/10/10
Major-Severe Storm 01/01/01

HF propagation conditions were normal over all regions.
Conditions are expected to remain sporadically unstable over
the high and polar latitude paths during the next several days.
Several weak interplanetary disturbances may be observed from
the minor flare activity that has occurred over the last
several days. Otherwise, near-normal conditions will persist
if these disturbances fail to arrive.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the

optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

I'm looking for some good FTP sites for Ham related programs, and anything
in general for Radio, or antennas for the IBM PC. I am especially interested
in programs that use the PC to decode CW and Fax, etc. Please E-Mail me,
as my news server sometimes screws up, and I miss a day or 2. Thanks,
Ron Hays

85. Mobile antenna question

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-08 16:32:50 UTC

Message-ID: <mbarts.1.00108C90@vt.edu>
Source record: 272530

A friend just recently purchased an Acura Integra and is trying to figure out how to mount a two meter antenna on it. He hasn't reconciled himself to getting out the big drill just yet and is considering a glass mount antenna on the hatch. The glass around the edges of the glass (where the antenna will mount) has black matte finish consisting of lots of small dots acting as a sunscreen. Does anybody know what this stuff is? Will it interfere with the glass mount, mechanically or electrically? Any suggestions or experience with this?

86. Re: RAMSEY KITS NOT TOO G

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-08 20:04:50 UTC
From: sehneg@austin.ibm.com
Message-ID: <CJBuG3.Bp6@hawnews.watson.ibm.com>
Source record: 272529

I've built several Ramsey kits, QRP receiver (40m) and several QRP XMTRS (40&20m)
plus keyer & FM stereo transmitter.

I'll concede that the early assembly manuals
were nothing more than a photocopy sheet, but they really redid their manuals
recently & they look close to the Heathkit quality.(XRAY drawings & tutorials)

I've batted 1.000 with their
kits, although I had to mess around with the 40m receiver a bit to stabilize
the thermal drift & make the receiver a little more selective. I've not had
a bad part in the bunch.
If you haven't tried them recently, you may be surprised.

I taught a ham class a few years back & we placed a quantity order with them
for the 40m receivers & lots of students built them while taking the class. We
helped them along, and got all of them working.(They give group discounts)

(standard disclaimers, my opinion & not that of anyone else), Gary N2KTY/QRP

87. Fixing loose BNC connectors on HT's

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-08 20:19:39 UTC
From: mjr@crl.com
Message-ID: <2gn4gr$46d@crl.crl.com>
Source record: 272528

Some months back (Oct. | Nov.) in MT there was a description of how to tighten up on BNC connectors that had gotten loose after many connect-disconnect cycles. The problem is that the V shaped inner connector becomes loose.

The article said to squeeze the ends of the inner connector together a little bit. It is not clear if you are supposed to take the connector *out* of the radio to do this. If so how? In my Alinco, this connector is seated very tightly in the plastic insulator. I could try to pry it out, but it seems as though I might be detaching it from what ever it is connected to if I do...

OTOH, I can not figure out what kind of tool I could use to squeeze together the ends while it is embedded in the insulator. I can get a fine needle between one side or the other and the insulator, but only one at a time. I have pushed a little this way, but it doesn't seem to make any difference. The finiest needle-nose pliers I can find are not nearly fine enough to get around both sides of the connector at the same time. How do you do this surgery?

Much Thanks

>Want to know where our repeaters are now? NOYGDB!
> - Brian

in my part of Florida, a first cut at locating repeaters consists of getting on top of the house at night and look for all the tower lights. most of 'em you can drive right up to the tower in your conventional power train car (no 4WD needed) using the publicly paid for road system.

Phase 2 is all those tall buildings (also marked with lights) that have a large excess of "lightning rods" are suspects as well (although it would take a bit more work to actually be able to say you could walk right up to the access door in these cases...but probably nothing more than to be around during normal business hours, find the building folks and ask about what's going on....

sorry your stuff was taken, but even on the hard to drive to mountain top, you can fly there with a DF system on the plane (and we'll throw in a GPS just to make it easier to determine lat/long than reading position and distance to a VOR (oh heck, i know there must be *one* DCE-400 around here..let it do the hard work).

it's all just a matter of perserverence (sp?). but i certainly agree with locking the doors just to keep the honest people off the suspects list.

Source record: 272537

So what are all those things you see at Wal-Mart? one of my co workers noticed them a while back...all the stores have them in this area.

they're located on the end of some shelves. they appear to be PVC about 3-4" thick and about 12-15" long with end caps on both ends (one with a hole).

the assembly is held onto the rack with tie wraps and is about 5 feet off the floor.

there seems to be no connections to it. the end caps seem to be permanently attached.

the store folks plead ignorance about them....and seemed to start wondering about them once we pointed them out...

Source record: 272538

> 1. They are proposing to charge you $7.00 per year for the rest of your
>life for their having issued you a specific callsign. I'd feel a lot better
>about a one-time charge, even at my age.

ok, how about $70 every ten years? everyone was complaining here a while back
that the FCC doesn't pay attention to amateur problems because we don't pay
for our licenses. this ought to do it. (700,000 x $7 = 4.9 Million/year..)

> 2. If your list of ten specific callsigns is exhausted by the time
>your application makes it through the mill, your existing callsign becomes
>the eleventh choice and you will be charged $7.00 per year for the rest of
>your life for the privilege of continuing to use your old callsign.

consider it a penality for making choosing poorly..could also be the start of
putting fees back on amateur radio licenses (everyone remember when it was $9
to do anything to your license....anyone? anyone?)

> 3. Opinion: what does "vanity" have to do with requesting a specific
>callsign? Commercial broadcasters do it all the time.

if you aren't "vain" about how you appear, you won't care and will take what's
assigned when you get your ticket. it's also a painless way to collect more
money from everyone participating forever until they croak. like lotto.

I have the same problem with my Alinco. From experience, the BNC
connector is the weakest link on the HT. I watched someone resolder the
inner connector...disassembling the radio to get to the BNC connectors
was not a pretty sight; it's pretty well buried.

But back to your problem... I used a tiny screwdriver; the kind you
tighten eyeglasses with; carefully inserted the screwdriver between the
metal and plastic, and pushed toward the center. Repeating for the other
piece of metal. That seemed to help. Nevertheless, I've seen better
quality BNC's than what's used in the Alinco.

93. Vanity Callsign Notice Of Prposed Rulemaking (PR93-305)

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-09 03:34:10 UTC
From: k1zat@bah.COM
Message-ID: <199401090334.WAA04709@booz.bah.com>
Source record: 272542

Bout time, but not quite enough. There should be provisions for:

-- Previous holders of a callsign to be able to request them
first, regardless of the geographical locale and mailing address
requirements. I.e.

94. Vanity Callsign Notice of Proposed Rulemaking (PR93-305)

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-09 03:34:24 UTC
From: k1zat@bah.COM
Message-ID: <Pine.3.05.9401082224.A4711-b100000@booz.bah.com>
Source record: 272543

Several other things should be considered in the NPRM. For instance:

-- Previous holders of a specific callsign. They should have first choice of getting it back if they want, regardless of the geographical locale of the call or the mailing address. I.E., if someone held a W6 and gave it up for a N3 but wants that W6 back he should be able to "retrieve" it without having to re-establish a California address to do it.

-- There should be a "staging period", similiar to what was done in 75-77, i.e. those licensed 25 years or more get first crack to pick for the first three months, then the 15-25 year licensed, and so forth.

-- Bring back the secondary callsign with this NPRM. It could be used for the those who want to retain their current one and retrieve one that was given up earlier; or as the original program had it, one for the summer (winter) home.

Wonder if the program will allow for retrieval of the repeater callsigns for use as individual callsigns? Imagine signing WR5AMU and not being a repeater...

jd

95. Re: Repeater database?

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-09 03:34:40 UTC
From: steve@info.pgh.pa.us
Message-ID: <steve-080194223440@fuzbat.pgh.pa.us>
Source record: 272544

Having noted both the interest in getting better data on repeaters, and particularly, on-line data on repeaters, and the concern with theft, I offer the following observations.

1) If someone wants your repeater badly enough, they will simply fox-hunt it. If people can find 1 watt HTs, broadcasting once a minute for ten seconds, they can *certainly* find any repeater with decent coverage. I often spot out of town repeaters by using simple body DFing. I mean, this is a trivial challenge.

2) I still understand the wish to deter the casual thief. This precludes giving any precise locational information. I will offer, however, that the casual thief isn't going to be able to make heads or tails of 40.0135N 80.0121W. Even if he figures out that those are latitude and longitude numbers, he *still* has to go to the library or other map depository and *find* the bleeping thing.

3) Even if you want to deter *that* guy (who is probably going to resort to plan 1 if he gets the plan 2 numbers and doesn't have the maps), you can simply give the data with insufficient accuracy to pin-point it.

While the less accurate data is off a lower value to the radio amateur, the value of the data is still very high. I mean, knowing where a repeater is to within 2 miles is of interest, and is usefull data. Knowing where it is to within a half a mile is only slightly more usefull. I will offer that having the data to the nearest five feet is of little or no value if you already have the 1/2 mile data, unless you're fixin to steal the machine.

Thus I offer the following. People wishing to report locations precisely can do so, but those unwilling to offer precise data can give data to the nearest (or spoofest) 2 or 3 minutes. At most of the latitudes populated, that would equal 1.5-2 miles in longitude, and 2 to 3 miles in latitude. This is certainly close enough to be usefull for amateur purposes, but not close enough to be usefull for, err.., slime purposes.

Those who don't wish to show their hands can simply give false coordinates of a nearby mountaintop for their machine. Those who *really* don't want to take part (because of latent paranoia?) can simply offer no information.

Just my two cents. I commiserate (sp?) with those who have lost equipment to thieves/vandals, but don't think that closing the door entirely is the answer. Closing the door only serves to deny the amateur community of valuable information, while only detering the casual thief.

Steve
N3OIE

P.S. If the thieves had been *truly* tasteful, they would have left the guy wires and the GE equipment intact. In fact, they probably would have left RCA gear in place of the Motorola, so that you would be up for at least a week. Of cousre, that would be adding insult to injury.

NOTE: The Effective Sunspot Number for 07 JAN 94 was 62.1.
The Full Kp Indices for 07 JAN 94 are: 1+ 1- 1o 3- 3- 1+ 2- 1o

SYNOPSIS OF ACTIVITY

Solar activity was low. Only a few low-level C-class x-ray flares were observed. Most of these were from Region 7646 (S08W66) which appears to be declining. Region 7648 (N06E02) is the largest group on the disk but has a simple magnetic structure and was quiet.

Solar activity forecast: solar activity is expected to be
low. Regions 7646 and 7648 pose a slight threat for an isolated
M-class flare.

The geomagnetic field was quiet to unsettled.

Geophysical activity forecast: the geomagnetic field is
expected to be predominantly quiet to unsettled for the next
three days. An increase to active is expected late on day three
due to coronal hole effects.

Event probabilities 09 jan-11 jan

Class M 20/20/15
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 09 jan-11 jan

A. Middle Latitudes
Active 10/10/40
Minor Storm 05/05/15
Major-Severe Storm 01/01/01

B. High Latitudes
Active 10/10/35
Minor Storm 05/05/15
Major-Severe Storm 01/01/05

Global HF propagation conditions were normal over the last
24 hours. Normal conditions should continue throughout the
next 72 hours. There is a slight chance high and polar
latitude paths could see occasional minor signal degradation
during the local night hours, although in general conditions
should remain near-normal through 11 January.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max, and end times are defined as: B = Before, U = Uncertain, A = After. All times associated with x-ray flares (ex. flares which produce associated x-ray bursts) refer to the begin, max, and end times of the x-rays. Flares which are not associated with x-ray signatures use the optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

: this?

My Ford probe has the same finish on the rear window. I had a cellular
phone antenna on the rear for a while, until I returned to school and
quit my job. The finish didn't appear to make the glass mount work any
worse than they do on other cars. When I removed the antennathere was no
damage to the finish either. I used constant pressure prying the box off
and then used a blow drier to heat up the adhesive. I didn't use a razor
blade.

good luck,
Dan

Hi All,
It sounds as if the NPRM , as written, will only allow you to
apply for one of the calls that have not yet been assigned. If this is
the case they won't be reissuing old calls. Is that the way everyone
else reads it or did I miss something?

Thanks,
Dan

YES! That's a better idea. Get one of Doug de Maw's QRP books and start collecting the parts. I didn't mention in my previous post about my non-working Ramsay 40m receiver that I had previously built three projects from the QRP notebook (1st edition) and they all worked great -- not to mention provided a ton of satisfaction.

The projects were, the Poor Man's QRP transmitter for 40m, the QRP antenna tuner and the 12v, 1 amp power supply -- All working GREAT, with great design and really cool surplus enclosures that I built myself. The transmitter is housed in a Planters peanut can -- what better for a peanut whistle? The power supply sits in the gutted housing of a dead auto battery charger -- with the labels changed to protect the ignorant, of course!

Hi Chris,

Yes.

Use the phone in the plane. It is not only against most airline rules to
use your own radio equipment on a commercial aircraft, it is unsafe.

There is no safe method for you to insure that your equipment is not
interfering with the aircraft's communication and navigation equipment.

That's why, essentially, it is not allowed.

102. Re: Theft/vandalism at radio sites (was Re: Repeater databas

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-09 14:58:14 UTC
From: dave@llondel.demon.co.uk
Message-ID: <758152694snx@llondel.demon.co.uk>
Source record: 272554

There have been several cases of remote-site amateur gear being stolen/vandalised in the UK. The first recorded case was the West London repeater some time ago, which vanished without trace until (several years later) they drained the water tower on which the repeater had been sited.... it was inside. A few packet nodes have been vandalised in the last year or so, and the Guildford voice repeater was stolen last month.

The best case was when someone tried to vandalise a repeater and got the wrong one.... as it belonged to the local police, the culprits got nicked fairly quickly!

What is bad about most of the cases reported is that the damage was almost certainly done by amateurs, or at least people with intimate knowledge of what they were doing, simply because of what was taken/broken and what wasn't.

Hello everyone,
I'm looking for a listing of Repeaters in the Montreal area and
if possible the actual municipality in which they're found (NOT the address)
just the municipality. Any help on this subject would be greatly appreciated.
Please leave message here or e-mail me, it's as you wish thanks again

ON a lot of planes the phone is in the seatback in front of you. Be
sure to use a credit card (scanners), and keep it short as the costs
can ring up (I racked up $15 talking to my wife for just a few minutes!).

>use your own radio equipment on a commercial aircraft, it is unsafe.

They even have walkmen and CD players turned off during takeoff and
landing (and I am not sure during the flight?).

>There is no safe method for you to insure that your equipment is not
>interfering with the aircraft's communication and navigation equipment.

I hadn't ridden a plane in 5 years until I went down to Melbourne, FL
for an interview. Whew, things on the plane had changed: seatback
phones and you had to turn off all the equipment!

>That's why, essentially, it is not allowed.

>it was inside. A few packet nodes have been vandalised in the last year or
>so, and the Guildford voice repeater was stolen last month.
>

Dave,

I'd be interested in knowing which repreater this actually refers to, since
the West London repeaters have always been sited on a hospital!

Maybe the folklore is a bit disturbed. 'WL WAS stolen, and was, in fact, dug
up in some Berkshire (?) woodland several years afterwards.

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 142
BID: $OPDX.142
January 10, 1994
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DF4RD, DL7VEE & DXNL, AD1C, N2PNG, K4CEF & Southeastern Cluster Group, K4MZU, K8BL and K8MBH for the following DX information.

1A0KM, S.M.O.M. Activity during the first part of the week was probably the work of a pirate. Usually the group that activates this station will announce when they will be on the air. SYGS! (Save Your Green Stamp)

9M2, WEST MALAYSIA. Just a reminder that Neville, G3NUG, will be active from three islands off the west coast of West Malaysia during January and February. His callsign will be 9M2/G3NUG and he prefers the frequencies 14260 and 18140 kHz (both +/- 5 kHz). Look for him on: Pangkor Is. (AS-072) from January 14-21, Langkawi Is. (AS-058) from January 22-28 and Penang Is. (AS-016) from January 29 to February 10. Neville mentions that there has been no activity from AS-072 and AS-058 for about three years. All direct QSL request will be cleared by the end February. QSL via CBA.

BV9P, PRATAS ISLAND. A group consisting of BV5AF, BV2AP, BV4AS, BV4OB and OH2BH were active from here on January 5th, for about 4 hours. It was reported that lots of VK and JA stations were heard calling the BV9P station on 14255 and 14260 kHz. There were no reports from anyone stateside that could not hear BV9P. Martti, OH2BH/VR2BH, was heard saying that another DXpedition would take place in March. Other reports also indicate that the BV9P group made about 630 QSOs with JA, BV and VK stations, and one single KH6 contact before going QRT.

EI4VRU CARDS. Barry, N2PNG, who has just returned from Ireland, states he made 1800 QSOs in the limited time he had to operate. There are two QSL routes available to use: N2PNG CBA or Barry Kennedy, POB 222, Austinburg, Ohio 44010.

HK0, MALPELO & GORGOLA ISLANDS. Ermanno was very active from Malpelo this past week as I2RAO/HK0 (not IT2RAO/HK0 as reported last week). He has gone QRT as of January 8th, but will returning on the air from Gorgola Island (in the Valle/Cauca Division group) January 12-15. It is unsure what this island will count for, so WFWL. There are many who hope his Malpelo operation will count (KYFC!).

HS, THAILAND. Fred, K3ZO, will be arriving in Thailand January 8th and returning on February 15th. During his time there, he will activate the club station HS0AC with his personal Thailand call, HS0ZAR. Fred plans to be very active on 40 meter CW, both morning and evening gray line paths. He states the bottom end of 40 meters is full of CB'ers from Indonesia on SSB, so look for him above 7015 kHz (sometimes even as high as 7030, but not down on the very low end of the band). In regards to 80 meters, it is not normally permitted for amateurs to operate in Thailand, but he has asked for special permission to use the band from 2200z, February 4th thru 1700z February 6th, CW only. If he gets this permission, ("Which is by no means assured," states Fred) look for him around 3513 KHz. There will be no skeds or nets!
Just a reminder that Reiner, DL2VK, is now active as HS0/DL2VK until January 31st. He will be active on all modes (mostly on CW) including PACTOR.

P5DTG INFORMATION. For the many stations that worked P5DTG back in November of 1992, here is some bad news. Responses are being received from Josef, OK1DTG, the QSL Manager and Operator stating that the P5DTG operation was an unlicensed operation. The information was printed on Josef's OK1DTG QSL card with the QSO information blank and lined-through and the operators call on it.

PY0, ST. PETER & ST. PAUL ROCKS. According to the son of PS7KM the planned three week DXpedition by four Brasilian operators to St. Peter & St. Paul Rocks that was to start January 10th, will be delayed until January 20th and will only be for two weeks. There were no reasons given for the delay. The group plans to have two stations working 24 hours a day from 160 to 6 meters on CW/SSB/RTTY/Packet. QSL SSB/RTTY/6m contacts to PS7KM and all CW contacts to PT7WA.

S2, BANGLADESH. K4MZU reports working Manju, S21AM, around 1240Z on 20 meters longpath. Manju is a Bangladesh national and is newly licensed. QSL to PO Box 4000, Dhaka 1000, Bangladesh.

DXCC HAPPENINGS. Another "Application For New DXCC Country" status was sent to the DXAC. Actually this application was a request to reinstate Aldabra Atoll to the DXCC Countries List. The application was filed by Kurt Bindschedler, HB9MX/S79MX, who was active from Aldabra November 1st and 2nd in 1993. Kurt believes Aldabra qualifies under the DXCC Criteria rule, "Point 1: by virtue of Governmnet." Aldabra was deleted from the DXCC List, June 28, 1976. All contacts now made June 29, 1976 and after with Aldabra counts towards Seychelles (S7). Kurt states, "the Seychelles government is the administrative authority for all outlying islands with the exception of Aldabra. Aldabra is administered by non-governmental, non-profit scientific and conservation organization

SIF (Seychelles Island Foundation). SIF consists of a board of trustees, the execxtive officer and several foreign well reputed personalities as members, with offices on Mahe and in London." Here are the coordinates: Longitude is 46 deg. 20 min. east / Latitude is 9 deg. 25 min. south.

KEEP THOSE BALLOTS COMING! (Only a 3 weeks to go!) Ballots for the Third Annual OPDX/NODXA DX Survey can be found in OPDX.137. Ballots can be sent to the following packet and online addresses listed below.

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and the FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

110. Re: Repeater database?

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-10 00:08:10 UTC
From: mjr@crl.com
Message-ID: <2gq69a$gj7@crl.crl.com>
Source record: 272558

Well I find myself sympathetic to both sides, so here is my $0.02, though this is getting off the subject of the database per se.

1) If repeater owners don't reveal link frequencies, then they must be prepared to suffer occasional interference. About the best a good ham *can* do is listen for a while (on an frequency they might want to use simplex), and having heard little, try it out, and see who (or if one) complains.

2) If repeater owners do reveal link frequencies, then they will probably suffer from deliberate interference from the *bad* hams, so take your pick.

3) I agree with Bob W. that location of a repeater is secondary to coverage information. Describing coverage succinctly is often a difficult thing to do. This is especially true in areas like N. CA. where you have a lot of mixed valley and mountain terrain. Some repeaters I know have very oddly shaped coverage patterns. Location, even accurate location, is therefore of limited help in determining coverage in many locations.

4) Any amount of information in a query-able database is better than nothing.

SB SAT @ AMSAT $ANS-008.01
PoSAT-1 BBS TO OPEN

HR AMSAT NEWS SERVICE BULLETIN 008.01 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-008.01

PoSAT-1 Opens For Radio Amateur Use

As many of you may already know, PoSAT-1 was built at University of Surrey and is owned by a Portuguese Industrial Consortium. It carries a commercial and an Amateur Radio payload. The Amateur Service hasn't yet started operation because of some doubts about the use of PoSAT-1 were brought up because of the the possiblity of misuse of the Amateur Radio spectrum.

AMSAT-PO (the Portuguese AMSAT "branch") and others were very worried about this situation, and after a few setbacks and many meetings, a protocol was finally established between the PoSAT Industrial Consortium and AMSAT-PO on 6-DEC-93. The main concern of AMSAT-PO was always to protect the Amateur bands and the Amateur code and practice.

Jose Carlos (CT1ERC) has provided the main points of that agreement which are as follows:

* RAM memory allocated to the Amateur store-and-forward BBS: at least 6 MB out of a total of 16 MB;

* The operating schedule (between the commercial and Amateur service) will be valid for two years and may be re-negotiated every two years;

* The Amateur ground stations are allowed to download all the files related to the technical and scientific experiments onboard, but by imposition of the Consortium, the IMAGES TAKEN BY THE ONBOARD CCD CAMERAS WILL NOT BE MADE AVAILABLE TO THE AMATEUR RADIO SERVICE!!!

In a meeting held recently between AMSAT-PO officials and the PoSAT Consortium the schedule approved is as follows:

EVERY minute PoSAT will be 5 seconds in the commercial frequencies and the remaining 55 seconds in the amateur frequencies. The Consortium feels that they need at lest 5 seconds to download the images. The telemetry will be downloaded in the amateur frequencies as well. This schedule will be valid starting on 07-JAN-94.

Since the amateurs aren't allowed to download the image files from the onboard cameras, there are the two experiments that will, however, be quite interesting. The are the following:

1) The onboard GPS receiver: if everything goes as expected, the days of difficult tracking are over. Just wait the AOS and the satellite will tell you were it is and where to point your antennas, if you know your QTH position.

2) The possibility of operation at 38.4 Kbps provided through the DSP system, which is will allow the amateurs to develope the necessary RF and digital techniques to go beyond 9600 baud. Imagine receiving about 100 Kbytes file in just 5 seconds!

PoSAT-1 will benefit mostly the amateurs that have 9600 baud operational capability and since there are only two of 9600 baud capable stations at the present time in Portugal operating regularly using these birds, your suggestions and comments would be most appreciated and might help AMSAT-PO in their contacts and negotiations with the PoSAT Consortium through AMSAT-PO.

The following are the PoSAT-1 radio amateur frequencies:

PoSat-1 Transponder Frequencies

UPLINK 145.975 MHz 145.925 MHz (Secondary)
DONWLINK 435.075 MHz 435.050 MHz (Secondary)

BBSCALL: posat-11 posat-12

MIR GETS A NEW CREW

HR AMSAT NEWS SERVICE BULLETIN 008.02 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-008.02

New Cosmonauts To Begin Stay on MIR

Today, 08-JAN-94, a Soyuz TM-18 spacecraft was launched from Baikonur at 10:08 UTC with three cosmonauts aboard. The new cosmonauts are Victor Afanassiev (U9MIR), Yuri Usachov (R3MIR), and Valery Poliakov (U3MIR). The TM-18 spacecraft is scheduled to dock with the MIR space station on 10-JAN-94. The cosmonauts that are currently aboard MIR,Vassili Tsybliev and Alexander Serebrov (R0MIR), will return to earth on 14-JAN-94.

What is interesting to note about U3MIR is that he will attempt to break Musa Manarov record for remaining in space. U3MIR is a medical doctor and will remain aboard MIR until April '95.

The new MIR QSL Manager is Serge Samburov (RV3DR). He has held that position since January '93. To receive a QSL confirming your MIR contact,

send your QSL cards to his postal address of: P.O.BOX 73, Kaliningrad-10
City, Moscow Area, 141070, RUSSIA. Also, you can send your inquiries to
the following packet radio address: RV3DR#R#MIR or RV3DR@RK3KP.#MSK.RUS.EU.

[The AMSAT News Service (ANS) would like to thank RV3DR and LW2DTZ for this
for the information which went into this bulletin item.]

STS-60 SAREX MISSION INFO

HR AMSAT NEWS SERVICE BULLETIN 008.03 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-008.03

Next SAREX Mission: STS-60

The STS-60 flight of the Space Shuttle Discovery represents the next
Shuttle Amateur Radio Experiment (SAREX) mission. STS-60 is
currently scheduled for launch on February 3, 1994 at 12:10 UTC. The
primary payloads on-board STS-60 are the Wake Shield Facility and the
second flight of the Spacehab, a pressurized module installed in the
forward section of the Orbiter. The Spacehab science objectives are
primarily micro-gravity oriented with emphasis on materials and life
science.

The flight of STS-60 represents an historic first---the first joint
U.S.-Russian Space Shuttle flight. This will be the first of several
joint missions planned in preparation for the development of the
international Space Station. Cosmonaut Sergei Krikalev, U5MIR, was
chosen to be the first Russian to fly on the U.S. Space Shuttle.
During the 8 day flight, Cosmonaut Krikalev will support the science
operations on the Space Shuttle as Mission Specialist 4.

The SAREX operations on this flight include voice and packet.
Preliminary discussions between the astronauts and the SAREX working
group indicate that the Shuttle crew will be extremely busy with the
numerous payloads on this flight. This information is being provided
so the amateur community is aware that voice operations might be rare
on this flight. Packet radio operations are expected when the crew
is not engaged in voice operations. Please remember that this is a
preflight prediction. The astronauts and the SAREX working group
cannot guarantee this prediction. The following information sheet
gives more details on SAREX operations for STS-60.

STS-60 Shuttle Amateur Radio Experiment (SAREX)
Information Sheet

Mission:STS-60 Space Shuttle Discovery
Wake Shield Facility & Spacehab-2 Mission

Launch: February 3, 1994, 12:10 UTC

Orbit: 57 degree inclination

Mission Length:8 days (Nominal)

Amateur Radio Operators: Charlie Bolden (License Pending), Ron Sega
(License Pending), Sergei Krikalev, U5MIR

Modes:FM Voice
Prime callsign: To be provided once Commander Bolden's callsign is known

Packet Radio: Callsign W5RRR-1

Frequencies: All operations in split mode. Do not transmit on
the downlink frequency.

Voice Freqs: Downlink: 145.55 MHz (Worldwide)
Uplinks: 144.91, 144.93, 144.95, 144.97,
144.99 MHz (Except Europe)
144.70, 144.75, 144.80 MHz (Europe only)

Note: The crew will not favor any specific uplink frequency, so your ability to
work the crew will be the "luck of the draw."

Packet Freqs: Downlink: 145.55 MHz
Uplink: 144.49 MHz

Info: Goddard Amateur Radio Club, WA3NAN, Greenbelt Maryland,
SAREX Bulletins and Shuttle Retransmissions
3860 KHz, 7185 KHz, 14,295 KHz, 21,395 KHz, 28,650 KHz
and 147.45 MHz (FM)

Johnson Space Center ARC, W5RRR, Houston, Texas
SAREX Bulletins 7225 KHz, 14,280 KHz, 21,395 KHz, 28,650 KHz, (SSB)
and 146.64 MHz (FM)

ARRL Amateur Radio Station, W1AW, Newington, CT
SAREX News Bulletins: 3990, 7290, 14,290, 18,160, 21,390,
and 28,590 KHz and 147.555 MHz (FM)

Also, bulletins available on internet, via AMSAT ANS, Compuserve,
and your local PBSS.

School Group Participation: 5 school groups will participate in SAREX with
pre-scheduled direct and telebridge contacts.
These include 4 in the U.S., and one in Russia.

Prelaunch Keplerian Elements: The following Keplerian Elements are provided by
Gil Carman (WA5NOM) at the Johnson Space Center

AO-13 TRANSPONDER SCHEDULES

HR AMSAT NEWS SERVICE BULLETIN 008.04 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-008.04

G3RUH Provides AO-13 "Provisional" Transponder Operating Schedules For '94

The AO-13 Ground Command Station of G3RUH has provided the "best guess" transponder schedules for the first half of '94. Please take the following schedules and paste them in a prominent place in your station.

AO-13 Provisional Mode Schedules 1994

L QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Jan 31-Apr 04
Mode-B : MA 0 to MA 90 |
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 |
Omnis : MA 230 to MA 30 | Move to attitude 240/0, Apr 04

L QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Apr 04-Jul 11
Mode-B : MA 0 to MA 160 | OFF
Mode-B : MA 160 to MA 220 |
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-BS : MA 230 to MA 250 | Blon/Blat 240/0
Mode-B : MA 250 to MA 256 |
Omnis : MA 250 to MA 160 | Move to attitude 180/0, Jul 11

G3RUH also has provided a table to indicate what the Bahn longititude and latitude for AO-13 will be in the upcoming year. Again, this information should be considered as the "best guess" and placed in a prominent place in your ham shack.

AO-13 Provisional Attitude Schedule 1994-5
==========

```
Date [Mon] Blon Blat SA to SA Weeks Notes
------------------------------------------------------------------------
1994 Jan 31 180 0 -36 35 9
1994 Apr 04 240 0 -2 29 14
1994 Jul 11 180 0 36 -33 9
1994 Sep 12 230 0 0 -26 14 < Up to 132 minute eclipses
1994 Dec 19 180 0 -34 33 9 MA 96-107 Oct 22 - Nov 07
1995 Feb 20 230 0 12 21 14
1995 May 29 180 0 30 -31 8
1995 Jul 24 230 0 -10 -22 15 < Up to 132 minute eclipses
1995 Nov 06 180 0 -30 34 8 MA 96-103 Sep 05 - Sep 21
1996 Jan 01 230 0 9 -- --
------------------------------------------------------------------------
Note: SA stands for "Sun Angle"
```

Unfortunately, because AO-13's perigee height has decreased from 1500 KM to 420 KM, G3RUH is unsure about whether AO-13 will still be in orbit by the end of '95 and into early '96. But if AO-13 has not re-entered into the earth's atmosphere, the above Bahn longitiude and latitude values will be the planned values.

[The AMSAT News Service (ANS) would like to thank G3RUH for this bulletin item. G3RUH can be reached at G3RUH @GB7DDX.#22.GBR.EU]

WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 008.05 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-008.05

Weekly OSCAR Status Reports: 08-JAN-94

AO-13: Current Transponder Operating Schedule:
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1993 Dec 27-Jan 31
Mode-B : MA 0 to MA 180 | OFF
Mode-B : MA 180 to MA 220 |
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-BS : MA 230 to MA 250 | Blon/Blat 240/-5
Mode-B : MA 250 to MA 256 | OFF
Omnis : MA 250 to MA 150 | Move to attitude 180/0, 31-Jan-94
Poor Sun angle and battery testing need maximum OFF time.
[G3RUH/DB2OS/VK5AGR]

FO-20: The following is the current FO-20 operating schedule:
From January '94 thru February '94, the analog mode and the
digital mode will be on alternately for a week at a time.
ANALOG MODE:
12-JAN-94 7:30 -TO- 19-JAN-94 7:50 UTC
26-JAN-94 8:20 -TO- 02-FEB-94 6:50 UTC
09-FEB-94 7:15 -TO- 16-FEB-94 7:40 UTC

DIGITAL MODE: Unless otherwise noted above. [JJ1WTK]

AO-16: Operating normally. [WH6I]

LO-19: Operating normally. [WH6I]

KO-23: Up and running. Busy as usual. [WH6I]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

>
> There is no safe method for you to insure that your equipment is not
> interfering with the aircraft's communication and navigation equipment.
>
> That's why, essentially, it is not allowed.

This is probably all the response that's necessary, however, it is just barely possible that the original inquirer may be a pilot, or somebody else who's planning to fly up there in a small private plane, rather than on an airliner. These generally don't have Airfones, although the use of cellular phones from one is still illegal because they activate too many different cells on the ground. In this case, it's the pilot's decision as to what radios may be used in flight, and it might be possible for the original inquirer to check for RFI himself, or to ask the pilot about doing so. If no RFI is observed (and you're DAMN sure there isn't any, because it's your skin on the line), or if the calls are made while flying VFR by pilotage, where no other radios may be needed at the time, then the question becomes reasonable. Not every flight needs radio navigation, or even radio communication. I don't know what such a person would do, unless they knew about a particular station in the area that they were flying over that had a phone patch available, and had arranged to use it. Does anybody have any ideas for this unlikely case?

113. Display Phone for Packet

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-10 03:04:32 UTC
From: William_A._Kirsanoff@smtpgty.anatcp.rockwell.COM
Message-ID: <9400097581.AA758171072@smtpgty.anatcp.rockwell.com>
Source record: 272562

I recently got a Northern Telcon "Display Phone" that I am trying to hook up to a PK-88. The phone is basically a smart phone with a dumb terminal attached, there real cute and have a small footprint. Now for the problem: the terminal does not recognize that it is attached to an RS232 device. It seems to want to detect the device and switch itself. I can access a screen that tells me the serial port is off line, but it does not allow a manual toggle like other set up features do. Northern-Telcon referred me to a tech who did not even understand that the serial port is hardware, not software, he did say he could change cards if there blown. :-)

I have the appropriate signals on pins 1-8 and 20, and the PK-88 works just fine with my HP-95LX as the terminal, but I would really like to get the display phone on line. Any one out there have any ideas, or know someone at Northern Telcon who could help?

Thanks and 73.

Bill

Sorry for the dumb question...but does anyone have a copy of
Morse code in ASCII they could e-mail me or tell me how to
ftp or finger so I can learn it?

Thanks MUCHO.

115. RFD: sci.geo.satnav

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-10 03:49:58 UTC
From: arkusinski_andy@si.com
Message-ID: <2gqj96INNeo9@rodan.UU.NET>
Source record: 272564
Cross-posted to: news.announce.newgroups,news.groups,rec.autos,rec.autos.tech,rec.backcountry,rec.boats,rec.radio.amateur.misc,sci.aeronautics,sci.engr.civil,sci.military,sci.space.tech

REQUEST FOR DISCUSSION: SCI.GEO.SATNAV

Title: SCI.GEO.SATNAV

This will be an unmoderated newsgroup.

SCI.GEO.SATNAV was chosen because the focus of this group is on navigation. The SCI.SPACE hierarchy deals with various aspects of space exploration and use, but this newsgroup deals mostly with terrestrial applications. The fact that the space segment is in space is almost incidental to the focus of the newsgroup.

Charter: SCI.GEO.SATNAV will allow a centralized location for discussion of global navigation satellite systems (GNSS). The charter specifically includes the US Global Positioning System (GPS) and Russian GLONASS, but is also open to discussion of other existing and future satellite positioning systems.

Some topics that fall under this newsgroup charter are:
* Technical aspects of GNSS operation.
* User experiences in the use of GNSS.
* Information regarding GNSS products.
* Discussion of GNSS policy (such as GPS selective availability).
* Extensions to basic GNSS technology, such as differential GPS and pseudolites.
* Navigational uses of satellite systems whose primary purpose is not navigation, such as a communication satellite net. (IRIDIUM, etc.)

Examples of topics that would not fall under the group charter are:
* Other satellite systems such as communications and intelligence gathering, except for navigational uses of such systems.
* Discussion of space policy in general.
* Discussion of areas that may use GNSS, such as surveying, sailing, or aeronautics, except as they directly relate to use of GNSS.

GPS, in particular, has turned out to be a technology with a great deal of synergism with many fields. GPS is used, not

only for military positioning which was the original
purpose, but in applications as diverse as entomology and
film making. A major intent of this newsgroup is to share
the uses to which GNSS technology is being put, thus
inspiring even more innovative uses.

While part of the SCI.GEO hierarchy, this newsgroup does not
exclude non-terrestrial uses of satellite navigation. For example, use
of GPS to determine space vehicle position is within the charter.

This group is also intended to function as a resource for
newcomers, who can post their questions and receive help
from others who have passed that way before.

Rationale: There is no single newsgroup where information
on GPS and other satellite navigation systems can be found.
Questions are often posted in newsgroups such as
sci.electronics, rec.aviation, and sci.aeronautics. To
address this lack, the mailing list RGPS DigestS was started
about a year ago, and now has over 400 subscribers.

Recently we attempted to convert GPS Digest from a moderated
weekly newsletter to an unmoderated reflector. Submissions,
which had been running at 2-3 per week, immediately picked
up to 15 the first day. Our resources were overloaded, and
the Digest is back to the original format. Many readers
indicated the real-time response was helpful and suggested
the formation of a newsgroup.

The RFD and CFV will be posted to the GPS Digest mailing
list as well as Usenet newsgroups. Only those readers with
access to Usenet should cast votes (for or against)
formation of the newsgroup.

I recall once making a patch for someone flying over (presumably not on a commercial airliner)

If you do want to try this, remember that amateur repeaters rarely (if ever) permit long distance calls, so you could only phone someone in a city you were flying over, while within range of the local repeater. It would not be possible to contact either your origin or desination while in mid-flight.

Assuming that you're on a private plane and transmitting with the consent of the pilot....

You might try an HF/SSB HT and look for someone to set up a collect patch. Although I've never used one of these little beasties and have no idea how well they work, AEA used to offer a 10M model, and that I believe J-Com still carries them under its own label and offers models for several different bands including 10M, 20M (hah!), and 40M.

I used a glass-mount antenna for a while and was extrememly unhappy with its performance. If your friend can't bring himself to get out the drill, you might suggest he try a trunk lip mount and snake the cables into the cab though the back seat.

And if his concern about drilling a hole for a proper roof mount is resale value, remind him that he can advertise the car as "cellular-ready." ;-)

Be forewarned that learning the code as visual of dots and dashes is not a particularly good idea, as it introduces an additional level of translation (aural to visual) that you will probably find puts an upper limit on the speed at which you will be able to copy. Ideally, you want to "hear" the characters, not "see" them in your head.

You would probably be better off visiting your local purveyor of ham goodies and investing in a cassette training course, or using a computer-based trainer. A good FTP site for the latter is "ucsd.edu" under "pub/hamradio" (if I'm not mistaken.) SuperMorse for DOS is dandy (look for "sm####" where "###' is a version number), and I'm sure you'll find some UNIX-based software there as well if that's better suited to your environment.

The ARRL takes a strong stand against instant licensing. It says that its time for all hams to say no!

*****
ARRL: NO TO INSTANT LICENSING

The American Radio Relay League has said no to the FCC's idea for a so-called "Instant License." The league says that P.R. Docket 93-267 is fraught with misgivings, not the least of which

would be the in ability of the amateur radio community to identify a person who has passed an Amateur Radio examination from someone who simply bought a radio, made up a call sign and went on the air.

By way of background, it was last November that the FCC issued the Notice of Proposed Rule Making in which it proposed that temporary operating authority for up to 120 days be granted to anyone who had earned a Certificate of Successful Completion of Examination. This, by passing the examination elements required to get any class of Amateur Radio license. The FCC put very few limitations on the program. It did say that any person with a history of non-compliance with the Amateur Service Rules would not be eligible to apply. It also noted that the FCC retained the right to cancel the operating authority at any time. And that was it. There were no other clear cut safeguards against abuses included in the proposal and that's what worried many hams.

Now, writing in the January 1994 edition of QST Magazine, ARRL-Executive Vice President Dave Sumner, K1ZZ states that the league has several major concerns with the proposal. These are with the planned system for on-the-air identification and the fact that the FCC has not proposed any safeguards to keep massive bootlegging from occurring.

Sumner notes that the call sign system being proposed would not in all cases conform to ITU regulations. He also points out that by being self assigned call letters, there would be absolutely no way for local amateurs concerned about the possibility of a non-licensed operator being in their midst. That there would be no way to check on the validity of the call sign being used.

The ARRL also questions whether or not the FCC has the authority to even propose such a self licensing scheme. K1ZZ notes that only a few years ago the Commission determined that it lacked the authority to implement a similar temporary licensing proposal and he goes on to question the basis on which the FCC has now made this about face.

According to Sumner the time it takes to issue a ham radio license can be cut down appreciably by eliminating much of the paperwork that now is involved and instead permit electronic filing of the completed applications by the nations Volunteer Examination Coordinators. He notes that the most of the nations VEC's appear to favor an electronic filing system to eliminate many of the paperwork delays now happening at the FCC's Gettysburg, Pennsylvania License Processing facility. Sumner says that this one change would result in the turn around time for processing any license to drop to only a few weeks while protecting the security of the license itself.

The ARRL is actively urging its members to take a strong position against the implementation of PR Docket 93-267. It has suggested that all concerned radio amateurs write in opposition

to the "Instant License" proposal from the FCC.

*****
VANITY CALL SIGN NPRM ISSUED

The FCC has now formally released its Notice of Proposed Rule Making, in PR Docket 93-305, aimed at permitting amateurs to choose a vanity call sign. Individuals as well as trustees of club stations will be eligible to request an available call sign from the block assigned to their license class or a lower license class.
A fee will be required for a vanity call sign. The Communications Act specifies a fee of 7 dollars per year for amateur service vanity call signs. It also allows the Commission to require payment of the fee in advance for a number of years not to exceed the relevant license term. Fee issues would be resolved under a separate FCC rule making proceeding, and the vanity call sign system would not be started until then, the FCC said.
If enacted, an applicant would have to provide the Commission a list of up to ten total call signs desired. The FCC would assign the first available requested call sign from the applicant's list. If none of the desired call signs was available, the applicant's current call sign would be reassigned. Call signs of lapsed or deceased licensees would not be available for reassignment for two years. A call sign relinquished under the vanity call sign program would be available for reassignment immediately.
The FCC said that even with its new automated licensing process it did not expect to be able to offer amateurs on-line access in order to check for call sign availability. It did however ask for comments on how such a service could be provided. The FCC says that its eventual goal is to accept all license applications electronically.
The comment deadline for P. R. Docket 93-305 is March 7, 1994. Reply comment deadline is April 7, 1994. The ARRL is asking its members to let their Division Directors know how they feel on this one as soon as they possibly can.

*****
LOS ANGELES PROBE

The probe into allegations of possible wrong doing by a growing number of Southern California Volunteer Examiners has taken a new twist. This, with word that some hams who upgraded at sessions run by these examiners have received letters from the FCC telling them that their tests have been disqualified. This is something that was expected from the outset since the FCC routinely takes this action anytime it deems a session is suspect.
What makes this case different is the possible number of hams

that could receive these notices. Newsline has learned that some of the test sessions involved took place almost a year ago. This means that some of those returning to lesser class licenses may themselves have become Volunteer Examiners and that the test sessions that they administered could be disqualified as well. Right now, the letters going out order the recipient to immediately cease using his or her upgraded privileges and to forward to the FCC by registered mail any Certificates of Successful Completion of Examination that have been awarded to them. The letters also reportedly say that in cases where the certificates have been used for further upgrade that the applicant must provide to the FCC the date, time and location of the testing session, the name of the Volunteer Examination Coordinator and the names, call signs and addresses of the Volunteer Examiners who provided the test.
If our information is correct and we have reason to believe that it is, then as many as 200 Southern California upgrades could be affected.

*****
LLOYD COLVIN, S.K.

Some sad news to report. Word has reached Newsline that famed DXepeditioner Lloyd Colvin, W6KG has died. Charles Mc Henry, W6BSY says that he received word from the Lloyd's son-in-law with word that W6KG passed away on December on 13th in Ankara, Turkey. At the time of his death, Lloyd and his wife Iris W6QL were in Ankara waiting for licenses to be issued for their next on-the-air operation. They expected their Turkey operation to least at least three months. In their long career as prominent DXers, Lloyd and Iris had operated from over 150 countries. DXer Lloyd Colvin, W6KG, dead at age 78.

*****
NEWSPAPER WRONG

Word that Thomas Lee Larsen, a convicted child molester now charged with an arson threat is not a ham. The San Jose Mercury newspaper reported that Larson was a licensed radio amateur. We checked Larson in the FCC's Amateur Radio database and in the Sam electronic call directory. Thankfully, there is no Thomas Lee Larson to be found. Someone might want to call the San Jose Mercury and tell the newspaper that it was wrong.

*****
SEDAR

SEDAR is an acronym for the newly formed South Eastern Dealers of Amateur Radio. The organization was formed at the Greensboro Hamfest to further the exchange of information and cooperation between members and assist all amateur club sponsored Ham Fests through out the South Eastern United States.

SEDAR is in the process of compiling an information booklet of all hamfests in approximately fourteen Southeastern states. If your club is planning to host a hamfest and your date is tentative, you may request a copy of other clubs' show dates from Sedar's secretary Kay Johnson KB4HHX, 5 Shoo Fly Circle, Ridgeville, SC 29472. Please be certain to include a self addressed stamped envelope with your information request.

*****
NEWSLINE SPEAKERS

While on the subject of ham radio conventions, word that we at Newsline now have speakers available to talk to your radio club, hamfest, convention, convention banquet or what have you. Many of Newsline's speakers are professionals in the world of broadcast journalism or the broadcast industry and possess a wide field of knowledge on many subjects allied to news gathering and dissemination. Through them you can learn the way that these Newsline bulletins are researched, authenticated, written, recorded and put to air while also finding out the advantages of having weekly Newsline ham radio news bulletins as a regular feature on your net or repeater. There is no honorarium charged within 25 miles of Los Angeles California and expenses only required anywhere else nationwide or world-wide. At least 60 days advance notice is required on out-of-town engagements. For further information on having a Newsline speaker at your gathering, please write to us at the address you will hear at the end of the newscast. Or you can call or fax us at area code (805) 296-7180. That number is good 24 hours a day.

*****
NJ QSO PARTY

A reminder from WB1GXM that February 12th and 13th is the date for the 1994 New Hampshire QSO Party. There will be 14 bonus point stations from across the state. The QSO Party is also a great place to work all ten New Hampshire counties needed for the New Hampshire Amateur Radio Associations Worked All New Hampshire Award. This award is administered by the North Country Amateur Radio Association of Lancaster, New Hampshire.

*****
DX

In DX, word that Fred Laun, K3ZO will be active from Thailand as HS0ZAR from mid-January to mid-February. Fred says to QSL to his home call.
Also LA5EBA, will be active as JW5EBA starting in mid January for 6 months. He will work for a meteorological station on Hopen Island, which is part of the Svalbard group that may qualify for a new IOTA number.

*****
TORA

A word of congratulations to a fine group of dedicated radio amateurs who spent New Years Eve out in the cold. Of coarse we are talking about those hams who help to coordinate the annual Tournament of Roses Parade from Pasadena, California. The group is known as TORA. That stands for Tournament of Roses Amateur Radio. Each year the TORA group is on hand to lend a hand to parade officials. Their main job comes when the floats and marchers start their way down Colorado Boulevard. Using video cameras and ham TV the TORA group is ever alert for any kind of an emergency situation that might develop. If they spot something they send their pictures back to the parade coordinator who can take the necessary action, TORA pioneered the use of ham television in the Tournament of Roses Parade almost two decades ago and the group has been refining the technology ever since.

*****
TOR-TV

Also, for those of you who tuned in early enough to catch the CBS network pre-parade show titled Coming Up Roses, be advised that it to had a ham radio connection. Anyone who caught the credits may have spotted it. Coming Up Roses was produced and edited by the same ham who co-produced the award winning New World of Amateur Radio. His name is Frosty Oden, N6ENV.

*****
WESTLINK YOUNG HAM OF THE YEAR

The Westlink Report ham radio newsletter has announced that its annual Young Ham of the Year Award will be presented June the 4th at 1994 Sea Pac Convention in Seaside Oregon. The Westlink Report Young Ham of the Year award was conceived to honor the younger members of the Amateur Radio Community. Hams aged 18 and younger who have used Amateur Radio to significantly contribute to the benefit of the service, to their community or the nation are eligible for it. With corporate underwriting from Yaesu USA Corporation, the 1994 winner will receive a trip to the Sea Pac convention, a piece of ham radio equipment and a special plaque denoting his or her accomplishments.
The cutoff date for submitting applications is April the 15th. The Winner will be notified in early May. All nominations must be submitted on an official application available for a self addressed stamped envelope to the Westlink Report Young Ham of the Year, 28197 Robin Avenue, Saugus, California 91350.

*****
And for this week, that's all from the Amateur Radio Newsline. You can write to us at Post Office Box 463, Pasadena, California 91102.

No, it's a straight (*ahem*) question.

It seems to me that the excuses for not covering Lambda are the
same as for not covering philatelists and train-spotters. Or
the reasons.

And, frankly, I'd prefer to see QST cover neither philately, train-spotting,
nor buggery.

Now that I've said that admittedly inflammatory thing, let me say that
ALL of these folks are legitimately hams, who inter-weave other key aspects
of their lives with ham radio. Be it stamps, trains, or what they point
their genitals at.

However, it seems to me that the 'angles' are irrelevant, and QST has
recently had the annoying tendency to show the cub-reporter's need for
an 'angle' story in order to fill up space.

The technical content of our journal has, in recent months, really
stunk. Oddly, some of the best technical material has been in the
'Beginner and Newcomer' section; perhaps in counting types of articles
for editorial purposes, these have counted as, and hence displaced,
more technical topics for more advanced hams.

I wouldn't mind the occasional article on "Hams Who Use Their HT's While
Bungee Jumping," if I didn't find that, by the time I wade through all
the ARRL and FCC news, and the semi-irrelevant "Human Interest" fluff,
I don't often seem to learn anything solid from QST. I'm better off
finding a back-issue and re-reading something by Lew McCoy or Doug
DeMaw.

So, rather than warning one another off constantly, though I guess it's good to know what you're in for, how do we encourage Ramsey to continue taking steps in the right direction, rather than driving them from the business?

Heath is gone, and with it THE major source of economical amateur radio gear, and 'on the job' training.

I've seen some of the first of the Heath ham gear, and it was probably in the category of 'not too good,' too. They were selling oscillator-only transmitters when such things were kind of marginal as state-of-the-art. And I'll bet their manuals didn't start out perfect.

Goodness knows Knight-Kit had its problems, though they went to school pretty well on Heath. Eico didn't go to school as well, and produced some real losers, along with a few winners.

And some people don't realize that that mainstay of 1950's and 1960's ham hear, E.F. Johnson, produced some of their more basic gear in kit form. If we'd known that buying them would have ensured us easy access to transimitting variables for life, we probably would have made the investment :-)

Anyway, I'm glad Ramsay and some of the others are around. But since they're really start-ups, they're going to have problems. The question is, how do we help them improve?

>knew about a particular station in the area that they were flying over
>that had a phone patch available, and had arranged to use it. Does
>anybody have any ideas for this unlikely case?

This subject has gone around so many times it's almost laughable. Anyway, the bottom line is this:
1. Most airlines specifically prohibit radios (and other electronics) during flight; there is an FAR on this.
2. On non-airline flights, it is the pilot's responsibility to determine if he/she wishes to allow the transmissions, with ONE exception:
3. Radio transmission during IMC operations is specifically prohibited by FAR.

I am a pilot, I am a ham....unfortunately, I find the two don't mix very well (when I'm piloting, I'm too busy hamming). However, I have no objection to another ham transmitting while I fly. I have never had any trouble with any ham radios in my airplanes. Note that the airline FAR is a precaution... and when you're talking about the lives of hundreds of persons, I can certainly understand why this precaution is taken so seriously.

Cheers!
Diana

In article <9401091132.A6377wk@support.com> steven.rosenberg@support.com writes:
>
>YES! That's a better idea. Get one of Doug de Maw's QRP books and start
>collecting the parts.

...or buy a kit of parts for one of those same projects from a
supplier of parts who expects you to work from the construction
article.

Personally, the part I *hate* is collecting the parts. After all,
in single-unit quantities they get to be expensive. Not to mention
the time and gas expended. 'Twas easier when I lived in silicone
valley, because I could get most things at Halted, two minutes from
work. (They also have Ramsey kits at discount prices, BTW)

Certain simple projects, like power-supplies, can be built from
Radio Shlock stock. But not many things.

These mini-suppliers seem to be the ARRL's answer to the complaint
voiced by many a dozen or so years ago that the QST projects were
fine if you had the ARRL Hq. lab's junk-box at your disposal. They
amount to a 'group buy,' with a little fee for the trouble of the
guy who puts it all in a bag.

The one that always tickles me is crystal controlled QRP transmiters.
They're usually designed and written by guys who must have a whole
box of surplus crystals. Buying crystals is now very expensive, and
the quality can be real iffy. VXO rigs are a bit better, but a
decent, basic, VFO is an experimenter's friend.

BTW, I believe that Doug DeMaw is a saint, as is Lew McCoy. These
folks, from the days of the 'Novice Transmitter Using Parts Gleaned
from Two Dead TV Sets' to the days of 'Tuna-Tin Two,' have always
shown what can be done with making lots of fun out of little money.
Another deity has to be Wes Hayward.

Their are a couple of heirs apparent, but they haven't come into
their own, just yet.

By the way (ARRL, are you listening), guys like these probably have
done more to increase the ranks of membership than all of the Civics
Book rhetoric about representation combined.

I asked this question about a month ago but didn't get any responce so
here it goes again.

I am looking for an excellent scanner antenna which will cover 30MHz to
1 GHz for my ICOM-R100. I would like to use this antenna to listen to
Police, fire, weather, aircraft, mall security, etc..... Does anyone
know off what "GREAT" all coverage antennas I could look for and what
frequency range are they speced at and what frequency ranges they really
cover good?... I really only want one antenna (I should be able to broadcast
from on 2M and 70cm also, for future upgrades) and it shouldn't be to obtrusive
to mount on the top of my truck.

Thanks,
John

I don't recall that the poster who started this thread actually said he wanted to call from an airplane. He sais he was going to Alaska, and wanted to "check on the kids", I believe, from 20'000 feet.

Do you suppose perhaps he's climbing Mt. McKinley (with a peak elev. of _20,300 ft_), and was looking for pointers to getting an amateur ticket so he could cart a radio up with him?

SB NEWS @ AMSAT $SPC0110
* SpaceNews 10-Jan-94 *

BID: $SPC0110

=========
SpaceNews
=========

MONDAY JANUARY 10, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* AO-16 NEWS *
==============
Recommended Operation Procedure to Reduce AO-16 Uplink Contention:

1993 has brought many new satellites and many new satellite users. It would be good to dust off an old AMSAT bulletin from 1991 to help refresh the "old-timers" procedures and to aquaint new users to the recommended uplink frequency usage.

The AO-16 Command Team recommends that users of the AO-16 PBBS system use only uplink channel D (145.960 MHz) for download and directory requests leaving channels A, B, and C (145.900, 145.920, and 145.940 MHz) for file uploads and digi users.

Stations uploading files should stay off of the download/directory/fill request channel D as their longer uplink packets will collide with the shorter request packets. Stations doing downloads and directories should stay off channels A, B, and C since their frequent but short requests will collide with longer uplink attempts seriously degrading uplink performance. Another benefit of using this procedure, while most of the uplink activity to AO-16 will be on channel D (145.960) this frequency is high enough in the passband of AO-13 that QRMing our fellow operators will be kept to a minumum when Pacsat crosses beneath AO-13's path.

Recommended AO-16 operating practice in summary:

Downlinks: 437.050 (also 2400.143 on experimenter's day.)
Uplinks: 145.900 A uploads
145.920 B uploads
145.940 C uploads
145.960 D downloads, fills and directory requests

: rather the damn thing worked! Steven Rosenberg, KC6FYL

I agree with Gary. I've built 4 of the Ramsey FM transceivers and repaired numerous others. There were missing parts which Ramsey promptly replaced. After minor modifications to correct the transmit audio problem, the squelch problem, and the Oct '93 QST modifications, these rigs perform just fine.

What Ramsey needs to do is include an Applications Note with each kit. All the problems have already been solved.

>Gary Coffman KE4ZV | You make it, | gatech!wa4mei!ke4zv!gary

I receintly built a hamtronics 2m receive converter, so I figured I would put in my 2 cents worth.

The converter shifts 144-146Mhz to 28-30 Mhz so 2M sideband can be received on a HF radio. It uses a dual gate gas fet for the front end, a J308 FET for a mixer, and a crystal osc and tripler for the LO.

The kit works with the following problems.

The converter generates spurs at 140Khz intervals when driven with a relative high level signal, about -40dbm. This is a real problem in my neighbood because there are several hams that also like 2m ssb and they run lots of power. This problem was solved by re-biasing the RF amp by replacing the gate bias resistor with a pot. The pot must be carefully adjusted so as not to kill the gain too much.

The whole converter oscillates at 27MHz when the antenna is removed. Does not oscillate with an antenna, so I guess I should not disconnect the antenna.

The LO (116Mhz) is present at the antenna connector at -30dbm. This causes big time channel 5 problems.
I beleive this is due to the LO and RF amp output both being injected into the gate of the J308 mixer FET. I experimented by replacing the J308 with a 40673 dual gate FET. I used a mixer schematic from the ARRL handbook. This does work, but the gain is very low, probably due to incorrect impedance matching. It did reduce the LO at the antenna by about 3db, hardly worth all the work.

Incidently, I called hamtronics to discuss my problems. They stated that their kits do not oscillate when constructed and aligned properly. The only suggestion they made was to short the second gate of the RF Amp to ground to remove the oscillation. It does remove the oscillation, but the gain and sensitivity decrease by 20db, so this is unacceptable.

The unit did serve its purpose. I decided that I wanted to play on 2m ssb so I will pick up some comercial equipment and shelf the converter.

I find this thief's taste to be interesting but I'm not sure that not telling anyone where your repeater is will stop this kind of activity. Someone with this kind of intent is not going to be stopped by lack of public information. If you have a 70 ft tower sitting on top of a mountain a good pair of binoculars is all that is needed to find it (and if you are really sophisticated a scanner with some type of DF antenna to get the general location). In case you haven't noticed, the backwoods areas of the west coast (and increasingly moving toward the east from CA with a real pocket up in north ID) are basically lawless. It all started with poachers, moved into large scale marijuana farms and has progressed to the point where some have begun packing guns on backpacking trips for self protection. And there is no one out there to stop them. It doesn't matter where you put this repeater if someone really wants a GE repeater - they will find it and they will get it. Don't forget - they can do this kind of thing at a downtown bank and that is far more difficult than going to the top of a mountain where they can basically do it at their leisure because even if it is alarmed it will take HOURS for anyone to get there to stop them.

Just a note - from my front porch in town I can actually see the towers for a large number of the local repeaters along with one's for the Forest Service, the Sheriff's Office, U.S.West, AT&T and a large number of radio stations. It doesn't take a lot of smarts to know that at the base of each of those towers is a building full of very expensive equipment. And a few minutes at the local store and a few dollars is all I need to have a 7.5' USGS map of the area which will show me the roads to any particular site and what is located there. If I was crazy enough to want that stuff it is not a question of locating it - it is a question of how to get into the building once I get there.

138. Telemetry continues from downed balloon

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-10 16:38:52 UTC
From: K7HFV@uugate.wa7slg.ampr.org
Message-ID: <43627@uugate.wa7slg.ampr.org>
Source record: 272512
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

SUPERBALL 1-94: LAST CHANCE TO COPY

Superball 1-94, the test of superpressure balloon technology carrying amateur radio beacons, is still transmitting.

The balloon, launched on January 7 at 1626z, burst about three hours later and landed in Utah's Uinta mountains, likely between 9500 and 10,000 feet elevation. A search party, on January 8, got within about two miles of the believed crash site, but were unable to continue due to steep terrain and deep powder snow. Whether recovery will be possible before spring remains uncertain.

Three beacons on the payload are still transmitting and have enough battery power to continue for at least several days. Reception reports are solicited. Reports from Illinois and Ohio have indicated good signals. Of particular interest are reports of reception through the Russian RS satellites, because this will give an idea of how practical this method of relaying telemetry will be for a later, longer-lived flight. Reports should include the receiving site, date and time of reception (preferably in UTC), and the frames of copied data. The frequencies are as follows:

Frequency	Satellite	Satellite Output Frequency
21.229 MHz	RS-12	29.429 MHz
28.322 MHz	(not on a satellite input)	
145.871 MHz	RS-10	29.371 MHz

The 21- and 145-MHz transmitters are on for three minutes and off for nine. They send CW (not MCW) carrying telemetry information.

The 28.322 MHz beacon simply keys on and off and does not attempt to send code. This beacon, alone, has solar power. The keying rate indicates whether it is operating on solar power or from batteries. Solar power is indicated by a rate near 40 pulses per minute; battery power by a rate near 20 pulses per minute. It is unknown whether recent snows may have covered the solar panel. This transmitter may die as batteries run down, and then come back to life next spring as snow melts and the solar panel is again exposed to sunlight.

Send reception reports via E-mail to:
WB7QBC@uugate.aim.utah.edu

140. RF Site/Region Modelling

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-10 16:50:33 UTC
From: ggjns@perot.mtsu.edu
Message-ID: <2gs10p$9p5@perot.mtsu.edu>
Source record: 272432
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.misc

Hello there folks. I am looking for information, pointers, etc.
on doing some terrain analysis with respect to radio signal (RF)
coverage modeling. I know that commercial consultants to broadcast
outfits use something along those lines, but (A) I've never really done
any serious elevation-dataset work, (B) I'm an ham who works with GIS,
(C) I can't afford the commercial rates for site modeling, and (D) I
have the data in hand in terms of ham radio repeater site locations, i.e.,
antenna height, effective radiated power, and the USGS Digital Elevation Maps
from resdgs1.er.usgs.gov for my area of interest (State of Tennessee, USA).
I am seeking any experiences from those of you who might have worked with
this application. I have access to GRASS 4.1 and AGIS/MAPIX GIS packages
for full treatment of DEMs, site modelling, etc. so that might suffice
rather than recommending I go buy a multi-hundred$ analysis package, or
paying similar consultant fees.

Doing RF modeling is not exactly on a line-of-sight basis, although
that's a good base to work out from in the beginning. Depending on
frequency there's a bit of bending that would influence signals in
valleys, etc. I plan on investigating those factors carefully from
other references. We are planning a packet-radio network that would
eventually span our state for message passing, hobby traffic, etc. and
good site planning is essential to our effort. Funding is out of our
back pockets which have more change than greenback, but there is a
wealth of raw materials out there (DEMs, GIS software, site info) which
give us a healthy start and will allow us to plan wisely. My lack of
personal experience in 3-D modeling leaves me with knowledge gaps on how
best to proceed.

Your input is appreciated; I would prefer responses directly to my mail
address (ggjns@knuth.mtsu.edu); if desired by anyone I can easily repost
a summary of responses. Yes, I've cross-posted this to relevant groups
in the GIS world, so apologies for its verbosity on basic stuff. PS,
GIS means Geographic Information System.

142. Re: Repeater database?

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-10 17:22:42 UTC
From: peterson@physc1.byu.edu
Message-ID: <1994Jan10.102242.1244@physc1.byu.edu>
Source record: 272460

After rereading my last post I realized I probably came across as somewhat negative. I do regret that some people have no respect for property and I am sorry that some repeaters sites have been targeted by the slime that seems to be covering our country. However, paranoia and secrecy won't stop the slime - they will get what they want for the simple reason that the law enforcement infrastructure is losing the battle against the slime. Unfortunately, secrecy doesn't work against the slime. The slime are not stupid - some of them are extremely brilliant but they have decided that it is better to use their brains to support the slime than to do something constructive. Hence, no matter what you do to hide your repeater - short of just shutting it off - will protect it from the slime assuming that they want it. At some point we have to balance the importance of providing useful information against that of protecting property and resources. All information can be misused in the wrong hands but if we lock up that information it will only slow the slime down slightly and greatly reduce the utility of whatever is being described. If I want I can have an unlisted phone number, take the numbers off my house, and only provide a post office box for my mailing address. But I am still not protected against the guy walking down the street who decides that I may have something he wants. And at the same time I have made it impossible for my friends to find me or for the ambulance to figure out which house is mine when I have a heart attack.

A recent post suggested giving fuzzy coordinates for the repeaters. Since I don't intend to operate in the direct vicinity of most repeaters (and if I am I already know exactly where it is) having the location within a mile or so would suit my purpose. Then, since I don't have coverage maps for them, I can look at where I am and where the repeater is located (direction and distance) and see if there is something like a mountain between me and the repeater. I will then have a vague idea of whether iI will be able to make it in or where I would need to move to in order to make it.

We scream at the government for their secrecy (look at the recent furor over AEC testing in the 40's and 50's) and yet we hide behind the same veil of secrecy. We expect everyone else to reveal sensitive information while being very adamant about not needing to reveal our own sensitive information. Let's try to strike a balance here and compromise on a level of information that will allow us to improve our use of limited resources (whether it's repeaters or spectrum allocation) while keeping the critical information quiet.

Bryan Peterson
peterson@physc1.byu.edu

P.S. - an interesting local example of what happens when you have things that are secret was brought up last night on a local 2m net. A person was fiddling

around with DTMF paging and messaging, a feature that is quite common on most new UHF and VHF radios. Unfortunately, out of ignorance he was bringing up all sorts of "hidden" features of the repeater like autopatches and connecting links. He was asked to stop using the DTMF features because of all the problems he was causing. There are ways around this (for instance, on one local repeater they have a special code that will cause the repeater to stop listening to DTMF codes so that a DTMF squelch or paging can be used without danger of messing up the controller) but secrecy is not the solution.

143. Hamfests near Colo???

Message-ID: <1994Jan10.172952.17636@worldbank.org>
Source record: 272434

I'm curious. Does anyone have any experience with HF (20 meters and above) Log Periodic antennas? I'd be particularly interested in learning how they compare with the TH-7DXX/KT34XA class of antenna.

(I'm moving house, and considering a LP to replace my venerable TH-7. I've been kicking around the idea of a L.P, to get WARC band coverage. However, if the performance is such that my TH-7, or a TH-11, will outperform them for DXing and contesting, then I may reconsider.)

Opinions/Comments ?

Thanks, Darrell NR3Y.

For packet I only use 5 watts.. But since this is my only radio, I have
to use this one for voice also, and in order to hit the one repeater, and
make my transmission readable, I have to use 50 watts..

Alex Lane responds:
-> A number of 2-meter repeaters offer users a phone patch that allows you
-> to make phone calls through the repeater. ...
-> Of course, this pre-supposes you're a licensed ham with a 2-meter rig.

Here's a consideration in airborne operation: please be mindful of your "advantage". Under nominal conditions your "footprint" is going to extend over a 200 mile radius when transmitting from FL200. That covers a _lot_ of repeaters. Before I transmit within the repeater input segment of the band, I do extensive homework in the repeater directory on the ground and monitoring in the air before trying to hit a "specific" repeater. I would discourage spur-of-the-moment repeater work from high altitude.

Don't get me wrong. I _love_ airborne operation on 2 meters and 70cm. There's nothing like getting a report of full quieting from 275 miles away when your putting out 2.5 watts from an HT. I'd encourage anyone who gets the chance to try it (legally). But it involves more than just walking on board and keying up.

BTW, for the home-grown lawyers out there, my operations were fully compliant with Combined Federal Regulations, Part 97, paragraph 97.101 and Federal Aviation Regulations, Part 91, paragraph 91.21.

Hello.

If this has been discussed before, I'm sorry, I haven't seen it.

The ARRL handbook mentions that we should keep the face of an amp
at least 24 " from our body, etc. Rigs, power supplies, antenna tuners,
and antennas are also hazardous to our health when set too close to our
body.

So now my amp is approx 4 feet from me, and my open wire antenna tuner
is now 7 feet from me. I'm also about 2 feet from the face of the rig.
I'm hoping that will do the trick to be immune from cancer...

They mention that attic antennas are a no-no, and it appears mobiling
douses your body with an rf field big time.

There is statistically significant cancer rates above the non-electronic
population.

What I want to hear out there is anyone who has done, or is knowledgeable
of work done in this field...Let us know.

Regards,

Marc

154. DXCC wait time

Source record: 272446

I recently sent in my endorsement application to the DXCC Desk at
ARRL. I was pleasant surprised by the processing time. The application
and cards were received on 12/29. The application was processed on
12/30 and the return package was postmarked 1/4. It probably would
have been quicker had there not been a holiday in that period!
Compared to the multi-month wait that I endured back in mid-1992
for my initial DXCC application, this is a pleasant, welcome change.
Thanks to the ARRL for really making the effort to get rid of the
DXCC backlog and keeping it from reappearing.

It might be hazardous because of RF burns: if you stand too close
to an emitting radar dish or high power antenna array you will get
burns on your body. Lower power WILL heat your tissues a bit, though
any claims of cancer are unsubstantiated and are probably bogus.

>So now my amp is approx 4 feet from me, and my open wire antenna tuner
>is now 7 feet from me. I'm also about 2 feet from the face of the rig.
>I'm hoping that will do the trick to be immune from cancer...

Well your tissues will probably be unheated (below the background
level anyway...

>They mention that attic antennas are a no-no, and it appears mobiling
>douses your body with an rf field big time.

It would depend on how your house is shielded. If you were to put a
layr of chicken wire between your antenna and next floor down, ground
it, your house should be safe.

If you have a car with a metal roof, placing the antenna in the middle
of it will keep the RF out of your vehicle pretty effectively. Also
I think the highest mobile wattage is less than 100 watts, no?
If you obey the reg that says you should communicate at the minimum
wattage neccesary you will probably operate at well below that figure.

Assuming that it could actually cause cancer...

>There is statistically significant cancer rates above the non-electronic
>population.

Depends on how the data was calculated. Perhaps the HAM community
is significantly older that the population at large, perhaps if
there is genetic propensity to be a HAM there will also be a
genetic propensity for cancer.

The answer is that there is no real knowledge of this. This whole
thing came about because of the 'power line' scares of the late 80's
and the lady's claim that using a mototrola portable phone gave her
brain cancer (despite the prevalnece of cancer deaths in her family)>

There might be a corrollation, but that does not prove causation!

>What I want to hear out there is anyone who has done, or is knowledgeable
>of work done in this field...Let us know.

I am currently studying Electromagnetics for a graduate degree.

I just wrote a program, actually modified SimpTerm to handle two windows. It isn't very well debugged yet, but if you want to try a copy I'll be happy to try to get it to you. I uses a split screen that you can make as large or as small as you want. There is a hot key that will let you toggle back and forth and there is a key that will zoom the screen up to full size and back. There isn't any terminal emulation. I'm working on that. Interested? Only works on com1 and com2 right now, but that is easily modified.

Jim.

Does the vainty call sign proposal mean that the FCC will allow NEW
club station licenses? There seems to be some ambiguity here.

The water tower was on top of of the hospital as far as I know. Perhaps 'tower'
was the wrong word and 'tank' might have been better. You obviously know more
about London repeaters than I do - I generally avoid them like the plague as
far as operating goes (it helps that I normally live out of RF range.....)

Anyway, how did this get into this thread? Anyone elsed mystified, look
elsewhere and you will find the original I sent :-)

SuperMorse is a *great* program for DOS. You can find it in
wuarchive.wustl.edu. It is named "sm404" and is in the directory
"/mirrors/msdos/hamradio".

>

Colorburst transmit frequency is required to be +/-10Hz (5.5873E-6 or 5.5873ppm).
PPM means parts per million.
This requires a good ovenized oscillator(that isn't cheap). Rubidium Oscillators
go for about $20,000 I think. Cesium Beam clocks are > $200,000.
The clocks that NIST uses are the best in the world. They have about 10 of them
that are all averaged together.

WWV, however loses a lot in its method of transmission and to propagation effects.
Received accuracy (if you have a stable enough PLL to track it without further
loss of accuracy) is about 1E-7 (0.1ppm) frequency accuracy and 1ms for timing.
Even to keep this accuracy would cost you at least $1000. Stratum 3 oscillators used in
non-central office telephone equipment are 4.7ppm and cost at least $2000.

Since the colorburst crystal in your TV is > 100ppm, any PLL that uses that
crystal to lock onto an external source cannot be any better than 100ppm.

WWV is not the problem. Unless you are in TV broadcasting I don't think you
would need better than WWV accuracy.

Incidently, NIST was working on a computer system where you could request time
and frequency by modem. It would figure out the delay of the telephone path
and compensate for it. Some manufacturers (True Time was one of them) was working
on clock sources that are locked to the GPS (Global Positioning System) system
with Stratum 3 accuracy and better timing accuracy.

Dave,

That's simple... just send a 610 in to the FCC. Change your address or
something. I have at least 2 copies of my extra license. When I changed the
address they sent a new copy and they also change your expiration date to
10 years after the date of the last change.

NOTE: The Effective Sunspot Number for 08 JAN 94 was 60.0.
The Full Kp Indices for 08 JAN 94 are: 1o 2o 3- 3- 3- 2+ 2- 1+

SYNOPSIS OF ACTIVITY

Solar activity was low. Only one C-class flare occurred:
an optically uncorrelated C1 at 1254Z. Region 7648 (N07W11),
the largest group on the disk, showed overall simplification
and was quiet. Region 7650 (N05W01) displayed modest growth.

Solar activity forecast: solar activity is expected to be
low.

STD: A long-duration class C8.2/SF flare was observed from
Region 7646 (S08W82) at 09/2323Z. The flare was accompanied by
a moderate Type II sweep that had an estimated shock velocity
of approximately 600 km/second.

The geomagnetic field has been at quiet levels for
the past 24 hours.

Geophysical activity forecast: the geomagnetic field is
expected to be generally quiet to unsettled for the next two
days. An increase to active is expected on day three due to
a favorably positioned coronal hole.

Event probabilities 10 jan-12 jan

Class M 15/10/10
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 10 jan-12 jan

A. Middle Latitudes
Active 10/15/60
Minor Storm 05/05/10
Major-Severe Storm 01/01/01

B. High Latitudes
Active 10/15/55
Minor Storm 05/05/15
Major-Severe Storm 01/01/05

HF propagation conditions were normal to above normal over
most regions today, particularly over the middle, low, and
equatorial regions. MUFs have remained enhanced about 10 to 20
percent above normal and the quiet levels of geomagnetic
activity have contributed to very good propagation over the
middle and lower latitude paths, with MUFs being enhanced in
many cases by as much as approximately 25 to 30 percent. No
significant changes are expected until 12 January when effects
from a well-placed coronal hole should produce minor signal
degradation over the high and polar latitude paths.

I know Bill, the owner and think he produces very high quality equipment.
The no-tune transverters require quite a bit of additional stuff to get them working as a system, including RX preamp, TX amplifier, two coax relays, control logic, and a case. But, given a good junk box and some skill, the results equal the more expensive complete transverters.

The views expressed here are my own, not my employer's.

Source record: 272455

First let me apologize to those of you who get both AMSAT-ANS and Amsat BBS
for the duplication.

Now then (flame on),

As many of you may be aware, some of us out here pay REAL money each and
evey time we receive something through our InterNet Gateway. This means
that the repeated forwarding of AMSAT-ANS
Bulletins is not only a waste of CPU time world wide, but also a waste of
OUR money.

I, and I'm sure many others, will appreciate "pi8daz@pa0okc.ampr.org" and
"on1aeo@pa0okc.ampr.org"
(and any others out there) turning off the auto-forward or other system
that is generating these duplicates and dumping them back to AMSAT-ANS.

I look forward to receiving only one copy of all future bulletins as I know
the owners of these two adresses will fix the problem imediately.

(flame off)
Thank you all for your assistance in this matter.

Ralph G. Sbragia, KD6FYT
InterNet>KD6FYT@AMSAT.ORG

|> could track an employee's movements even if the employee did not use
|> it to operate the door. Does anybody want to comment on this?

I don't know about the CD/tape security stickers, but I do know something
about the card reader gizmos.

The card itself is a thin printed circuit board with thin surface mount
components. It also has a coil of wire which is the secret to it's power
source. The circuit is some sorta ultra-low-power RF transmitter with
a unique serial number programmed into it. The box on the wall by the door
emits a magnet field which induces power into the card via inductive coupling.
Once the card has sufficient juice from the coil, it transmits a signal to the
receiver, also in the wall box. The signal is digitally encoded with the
unique serial number.

The rest is easy. The receiver sends the serial number to the system's CPU
where it looks up the number in it's "database". If you fit all the criteria
for access at that time, bingo, you're in.

I hope that helps. I also hope someone has the CD/tape sticker answer.
I have some theories, but I'd like to see someone else verify them before
I go sticking my foot in my mouth.

Statistics are funny things. If you take the often quoted Milham article entitled: "Increased Mortality in Amateur Radio Operators Due to Lymphatic and Hematopoietic Malignancies", the statistics show a slight increase in the incidence of leukemia amongst hams in Washington State and California over a 5 year period (36 deaths compared to an expected value of 29, corresponding to a death rate for hams of 7.1 per 100,000 vs. the normal population rate of 6.7 per 100,000). Pretty convincing?

Now look at deaths from all causes and find that hams had 2,485 compared to an expected number of deaths of 3,479. Does this mean that if you are a ham you have less chance of dying than others?

The data were suspect as well. The list of dead hams came from the Silent Keys announcements in QST. Other ham data came from the FCC database. There was no indication of operating habits (if at all), homebrewer vs appliance operator, length of time as a ham, sex of the operator (he eliminated female names manually), or other mitigating factors, except he did get occupation from the death certificates (31% had electrically related jobs).

The bottom line is that I put little stock in this study. The numbers are too small and the data are too incomplete.

>What I want to hear out there is anyone who has done, or is knowledgeable
>of work done in this field...Let us know.

I am a professor of biomedical engineering and neurology. I study brain tumors (mainly curing them, not causing them) but I am embarking on a study with rats to see how their tumor growth is affected by rf.

On a related line. What good terminal programs allow for individual windows for each stream in multiuser mode. It would also be nice to have a window to monitor other QSO's without all the extra garbage. For instance you could just use your mouse to select a transmission and then all other transmissions to or from that station would be sent to a window and preceeded only with the sending station's call. It would be nice if it also compared the current packet to the last recieved packet from the station and not display duplicate packets that I recieved but the recipient missed. While there is probably nothing out there that has the monitoring features I would like is there an easier way to manage multi-stream conversations?

Thanks,
Dan

No it doesn't. Any decent AT cut crystal oscillator will hold +/- 5 ppm over
any reasonable indoor temperature range (10 to 50 degrees C).
That ought to run you about 10 bucks.

> Rubidium Oscillators
>go for about $20,000 I think. Cesium Beam clocks are > $200,000.

Rubidium standards start at less than $2000.
Cesium standards cost from $30,000 to $70,000.

> Stratum 3 oscillators used in non-central office telephone
> equipment are 4.7ppm and cost at least $2000.

No they don't. Stratum *2* oscillators are the ones that cost around $2000.
And they are far more accurate than 4.7 ppm.

>and compensate for it. Some manufacturers (True Time
>was one of them) was working on clock sources that are locked to

A good GPS system should be able to achieve
Stratum 1 accuracy (1 part in 10^11)
not just Stratum 3 accuracy (worst than 1 part in 10^6).

>value, remind him that he can advertise the car as "cellular-ready." ;-)

Hmmm...I've seen a lot of talk about drilling a hole affecting resale value but in the years I've been on the info-hams list, I have yet to hear of a single case where someone said something like "because that hole was drilled in the car, I'm reducing my offer by $XX". Can anyone cite a case where a properly and cleanly done drill-hole antenna mount has resulted in a lower resale value?

I have three permanent (drill-hole) antenna mounts in my two cars. Two are Larsen NMO mounts and one is a Hustler side-mount for my HF antenna. In probably 50,000 miles of driving including two or three salt-and-sand New England winters, there is not even a speck of rust or chipped paint anywhere near any of the mounts. On the other hand, there are quite a few scratches from the magmount I used to use on one of the cars. A proper and clean permanent drill-hole mount is easy to do and offers nothing but advantages over any other type of mount: better placement for a better ground plane, no window losses, no more door-squashed coax. BTW, Larsen makes a wonderful hole driller to make a perfect hole for their mounts. See if your local ham store or commercial radio shop will loan you theirs...

You've died & gone to heavan, Dave! Lots of great surplus shops and two of the best regular hamfests I know of ... Once a month on the first Sunday, out at Las Positas Community College in Livermore is a swap sponsored by the LARK (livermore Amateur Radio Klub). It's year round rain/shine and more popular during the winter months.

From March through October, there's the world-famous Foothill Swap at Foothill Junior College in Los Altos Hills. Second Saturday. This is by far the best I've ever been to (alas, I don't travel to Dayton). Tons of modern radios, vintage stuff, audio stuff, DOS Box trash, real computers, test equipment, components. Ahhh -- I feel the excitement building. Best ones are the first (March 12) and the last.

Scott

P.S. Look me up when you get here -- I monitor 145.23- (100Hz PL)

I couldn't find an exact figure to back this up, but quoting "NBS Special
Publication 432" (National Bureau of Standards, which is now the
National Institute of Standards and Technology (NIST)) (#432 supersedes
publication 236) for WWV (Fort Collins, Colorado) & WWVH (Kauai,
Hawaii): "Accuracy and Stability: The time and frequency broadcasts
are controlled by the primary NBS Frequency Standard in Boulder,
Colorado. The frequencies as transmitted are accurate to within one
part in 100 billion (1x10^11) at all times. Deviations are normally
less than one part in 1000 billion (1x10^12) from day to day. However,
changes in propagation medium (causing Doppler effect, diurnal shifts,
etc.) result in fluctuations in the carrier frequencies AS RECEIVED by
the user that may be much greater than the uncertainty described above.".

A binary coded decimal (BCD) time code is also transmitted on a 100Hz subcarrier by WWV & WWVH.

The audio portion of these broadcasts can be heard via telephone (but not the RF carriers). At (303)499-7111 for WWV and (808)335-4363 for WWVH. The accuracy received anywhere in the contiguous 48 states is 30ms or better.

Now if you want real accuracy (:-)), try WWVB (Fort Collins, Colorado). This is a BCD time code only (1 bit per second!) on a 60KHz radio carrier. And to quote publication 432 again: "The frequency of WWVB is normally within its prescribed value to better than 1 part in 100 billion (1x10^11). Deviations from day to day are less than 5 parts in 1000 billion (5x10^12). Effects of the propagation medium on received signals are relatively minor at low frequencies; therefore, frequency comparisons to better than 1 part in 10^11 are possible using appropriate receiving and averaging techniques.".

From publication 432: "Frequency Calibration Service Using Network Television: For those users who require only frequency calibrations, an alternative to the radio broadcasts is available. This service provides a means of calibrating oscillators traceable to NBS. It gives the user the option of calibrating his oscillator quickly at very low cost, with modest accuracy, or of expending more time and money for higher accuracy.".

"The service is very reliable because the networks use extremely stable rubidium or cesium oscillators to generate the 3.58MHz color subcarrier frequency which is transmitted with all color programs. The color signal is then used as a transfer standard. Any oscillator that has a frequency of 10/N MHz, where N is any integer from 1 to 100, can be calibrated.".

"If a user wants to make a calibration, he compares the color signal coming from the network centers in New York City (or Los Angeles for those on the West Coast) with his local oscillator. NBS monitors the same network signals and publishes the difference between the network oscillators and the NBS Frequency Standard in the monthly NBS Time and Frequency Services Bulletin. A user then knows two things: (1) the difference between his oscillator and the network oscillators (by measurement) and (2) the difference between the networks and NBS (by publication). With this information, he can easily compute the difference between his oscillator and NBS. Thus, his calibration is traceable to the NBS Frequency Standard.".

"NBS has developed two methods for making these frequency calibrations. Equipment is commercially available for both methods.".

"Color Bar Comparator Method: The color bar comparator is a simple circuit that connects to a standard color television set. It produces a colored bar on the screen that changes color or moves across the screen at a rate that depends on the frequency difference between the user's oscillator and the TV network signal. By timing these changes with a stopwatch and referring to the data published by NBS, an oscillator

can be rapidly calibrated to an accuracy of 1 part in 1 billion (1x10^9).".

"Digital Offset Computer Method: The second method, using a digital
offset computer, provides an automatic means of calibrating high-
quality crystal or atomic oscillators. It compares a signal from the
user's oscillator with the TV color signal and displays the frequency
difference on the TV screen as parts in 100 billion (parts in 10^11).
If measurements are averaged over about 15 minutes, a calibration
accuracy of one part in 100 billion can usually be achieved.".

NBS time can also be received via the GOES (Geostationary Operational
Environmental Satellite) satellites of the National Oceanic and Atmospheric
Administration (NOAA).

> Even to keep this accuracy would cost you at least $1000. Stratum 3 oscillators used in
non-central office telephone equipment are 4.7ppm and cost at least $2000.
>
> Since the colorburst crystal in your TV is > 100ppm, any PLL that uses that
> crystal to lock onto an external source cannot be any better than 100ppm.

I am building a self-resetting clock which uses WWVB and should have
an accuracy of around 1ms (which is much more than needed for a clock :-)).
I have a current version which has been running for over 10 years which
as I remember is accurate to around 1/256 of a second. So the important
factor for accuracy while NOT receiving the WWVB signal is the STABILITY
of the crystal (not the frequency accuracy).

For more information on receiving WWVB, see Don Lancaster's articles
in Radio Electronics: July 1972 (pages 54-58), August 1972 (pages 60-62),
August 1973 (pages 48-51 - this starts the WWVB part), and September
1973 (pages 98,101). I only used the design for the receiving antenna
and preamp (which are not my areas of expertise) and threw out the rest
of the design and replaced it with a microprocessor (note the dates on
the articles :-)). I am lucky that I live in Colorado, so I didn't need
to use any of the fancier receiving methods which Don Lancaster describes
in his articles.

> Incidently, NIST was working on a computer system where you could request time

This has been running for some years now. Last I knew, the phone number was 1-303-494-4774 . ... still seems to be. It answers at 1200 or 300 bps only. The delay compensation works if your computer echoes all characters sent by NIST. With most modems, syncrhonization should be possible to within about +- 10 msec of the correct time. No frequency standard is provided by this service.

CM> Message-ID: <2gkha4$n2l@hp-col.col.hp.com>

CM> I am going to Alaska again this year, and would like to investigate
CM> whether it is possible to make phone calls from way up high by radio
CM> (check on the kids, etc.). Is this possible to do via a portable
CM> radio? If so, can you give any pointers on how to get started...I
CM> have until May 27 to get this going.

If you're flying Alaska Airlines, they have phones in their aircraft.
Otherwise, if there's not an inflight phone, you cannot legally use a portable
radio or telephone.

DAILY SUMMARY OF SOLAR GEOPHYSICAL ACTIVITY

10 JANUARY, 1994

/\

(Based In-Part On SESC Observational Data)

SOLAR AND GEOPHYSICAL ACTIVITY INDICES FOR 10 JANUARY, 1994

NOTE: Minor stratospheric warming exists over Siberia, Alaska, and Canada
and is weakening. However, new warming over the Mediterranean area
is intensifying and spreading northeastwards. The polar region is
cooling.

NOTE: The Effective Sunspot Number for 09 JAN 94 was 58.5.
The Full Kp Indices for 09 JAN 94 are: 1o 1- 2- 1+ 2- 2- 2- 1o

SYNOPSIS OF ACTIVITY

Solar activity was low. Departing Region 7646 (S09W93)
produced a long duration C8/SF at 09/2323Z with a moderate
intentisy Type II and minor centimeter bursts. Region 7650
(N05W13) grew slightly and now 7650 and 7648 (N06W24) appear as
abutted bipoles.

Solar activity forecast: solar activity should continue
at a generally low level. An isolated M-class flare from
Region 7646 or the 7648/7650 complex is possible.

STD: Moderate Ca XV emissions were observed on the west limb
today. The intensity of the emissions has decreased from
strong levels which were observed yesterday.

The geomagnetic field was quiet at all sites.

Geophysical activity forecast: the geomagnetic field
should be quiet until late on 11 Jan when a coronal hole
related disturbance is expected to begin. Active to minor
storm conditions are forecast for 12 Jan with unsettled to
active levels forecast for 13 Jan.

Event probabilities 11 jan-13 jan

Class M 20/15/15
Class X 05/01/01
Proton 05/01/01
PCAF Green

Geomagnetic activity probabilities 11 jan-13 jan

A. Middle Latitudes
Active 20/50/30
Minor Storm 10/30/15
Major-Severe Storm 01/05/05

B. High Latitudes
Active 20/50/30
Minor Storm 10/30/15
Major-Severe Storm 01/10/05

HF propagation conditions were normal to above normal over
all regions. Conditions are expected to return to near-normal
on 12 January for low and middle latitude paths, while high and
polar latitude paths should see periods of minor signal
degradation (mostly on night-sector circuits) due to
anticipated minor enhancements in geomagnetic and auroral
activity from a well placed solar coronal hole. Conditions
should begin returning to near-normal over the higher latitudes
on 13 and/or 14 January.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.

All times associated with x-ray flares (ex. flares which produce associated x-ray bursts) refer to the begin, max, and end times of the x-rays. Flares which are not associated with x-ray signatures use the optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

191. Last chance to copy Superball 1-94

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-11 08:08:14 UTC
From: gsmith@rahul.net
Message-ID: <CJGH9r.DBz@rahul.net>
Source record: 272485

SUPERBALL 1-94: LAST CHANCE TO COPY

Superball 1-94, the test of superpressure balloon technology carrying amateur radio beacons, is still transmitting.

The balloon, launched on January 7 at 1626z, burst about three hours later and landed in Utah's Uinta mountains, likely between 9500 and 10,000 feet elevation. A search party, on January 8, got within about two miles of the believed crash site, but were unable to continue due to steep terrain and deep powder snow. Whether recovery will be possible before spring remains uncertain.

Three beacons on the payload are still transmitting and have enough battery power to continue for at least several days. Reception reports are solicited. Reports from Illinois and Ohio have indicated good signals. Of particular interest are reports of reception through the Russian RS satellites, because this will give an idea of how practical this method of relaying telemetry will be for a later, longer-lived flight. Reports should include the receiving site, date and time of reception (preferably in UTC), and the frames of copied data. The frequencies are as follows:

Frequency	Satellite	Satellite Output Frequency
21.229 MHz	RS-12	29.429 MHz
28.322 MHz	(not on a satellite input)	
145.871 MHz	RS-10	29.371 MHz

The 21- and 145-MHz transmitters are on for three minutes and off for nine. They send CW (not MCW) carrying telemetry information.

The 28.322 MHz beacon simply keys on and off and does not attempt to send code. This beacon, alone, has solar power. The keying rate indicates whether it is operating on solar power or from batteries. Solar power is indicated by a rate near 40 pulses per minute; battery power by a rate near 20 pulses per minute. It is unknown whether recent snows may have covered the solar panel. This transmitter may die as batteries run down, and then come back to life next spring as snow melts and the solar panel is again exposed to sunlight.

Send reception reports via E-mail to:
WB7QBC@uugate.aim.utah.edu

>>
>>The ARRL handbook mentions that we should keep the face of an amp
>>at least 24 " from our body, etc. Rigs, power supplies, antenna tuners,
>>and antennas are also hazardous to our health when set too close to our
>>body.
>
The point of this recommendation was to minimize the 60 Hz exposure
from this equipment. Since it falls off rapidly from the source.

>It might be hazardous because of RF burns: if you stand too close
>to an emitting radar dish or high power antenna array you will get
>burns on your body. Lower power WILL heat your tissues a bit, though
>any claims of cancer are unsubstantiated and are probably bogus.
>
Bogus, hum. I suggest you review your course work regarding cellular
membrane theory and cancer promotion. Pay particular attention to
the information on soliton formation.

>>So now my amp is approx 4 feet from me, and my open wire antenna tuner
>>is now 7 feet from me. I'm also about 2 feet from the face of the rig.
>>I'm hoping that will do the trick to be immune from cancer...
>
>Well your tissues will probably be unheated (below the background
>level anyway...
>
>>They mention that attic antennas are a no-no, and it appears mobiling
>>douses your body with an rf field big time.
>
No question about RF and mobiling signals. Would you put an attic
antenna next to you and not worry just a little? If not you, how
about your wife. Maybe you would worry about your children?

>It would depend on how your house is shielded. If you were to put a
>layr of chicken wire between your antenna and next floor down, ground
>it, your house should be safe.
>
I do not know where you are getting this type of thinking, but
inspite of shielding, once you are in the near field of an antenna
there is not much you can do about exposure. I tell you what,
why don't you wrap your house with chicken wire and when you
are ready, I'll come out and measure the RF???

>If you have a car with a metal roof, placing the antenna in the middle
>of it will keep the RF out of your vehicle pretty effectively. Also
>I think the highest mobile wattage is less than 100 watts, no?
>If you obey the reg that says you should communicate at the minimum
>wattage neccesary you will probably operate at well below that figure.
>
>Assuming that it could actually cause cancer...
>
>>There is statistically significant cancer rates above the non-electronic
>>population.
>
>Depends on how the data was calculated. Perhaps the HAM community
>is significantly older that the population at large, perhaps if
>there is genetic propensity to be a HAM there will also be a
>genetic propensity for cancer.
>
>The answer is that there is no real knowledge of this. This whole
>thing came about because of the 'power line' scares of the late 80's
>and the lady's claim that using a mototrola portable phone gave her
>brain cancer (despite the prevalnece of cancer deaths in her family)>
>
There are currently a series of prospective and retrospective
articles appearing in the literature which point to the likely
relationship between some forms of cancer in children and proximity
to power lines. This is no scare tactic, I assure you.

>There might be a corrollation, but that does not prove causation!
>
>>What I want to hear out there is anyone who has done, or is knowledgeable
>>of work done in this field...Let us know.
>
>I am currently studying Electromagnetics for a graduate degree.
>
Actually, I co-authored the section in the ARRL handbook on the
RF safety things. It was written and reviewed by several of the
most respected scientists in the country who also just happpen
to be hams. The comments I have reviewed here are typical of
the general misunderstanding and ignorance on behalf of general
ham population. May I suggest a more thoughtful approach to posting
comments on this forum. I am tired of seeing it. Dave.

>
>By "dead bug style," do you mean surface-mount parts? I can't imagine
>a 2304 MHz assembly working with "traditional" dead-bug construction....

No, I mean traditional leaded parts suspended by the leads of other parts. That's for the LO of the 902 transverter, not the 2304. The actual 902 part of the transverter is true surface mount using MMICs and DBMs.

>> Ramsey has greatly improved
>>their 2 meter and 70 cm transceivers from the original models, but they
>>aren't bargains. Converting commercial surplus will still give you a better
>>radio for less money.
>
>When did the new & improved kits come out? Also, how much effort is it
>to make commercial surplus frequency-agile?

They made running changes to the design and documentation. The kits made after mid-93 should have the changes. They still aren't great, but some of the worst problems were addressed. As to commercial equipment, most of the older stuff had 8 frequency decks available, and the newer programmable units can have up to 16 channels preset. Few people really need more frequency agility than that. I don't think I have as many as 16 frequencies programmed into any of my radios, and some of them have 100 memories.

>to mount on the top of my truck.

The only antenna that will cover from 30-1000 MHz is a discone, and that
has 0db gain, and certainly wouldn't be unobtrusive on the top of your
truck. :-) It would work for 2 meters and 70 cm transmit though. Lots
of people use them as base antennas. Radio Shack sells one, as does Icom,
though the RS one doesn't have the whip to extend the coverage down to
30 MHz, you can add one, and it's *lots* cheaper than the Icom antenna.
It's construction is fairly sturdy too.

Gary

Reconsider. I don't know of any off the shelf LPs that will match your
current antennas. HyGain made some special ones for the military that
would be a match for your current antennas, but they were huge. In general,
an LP must be *much* larger than an optimized yagi for a given frequency
to have equivalent performance.

Hi...finally got cards from MS and UT. Now I need Idaho! I've made several contacts into ID, but two of my cards have been "return to sender" (no forwarding from old callbook address) or my card disappeared into a black hole. Any folks from Idaho care to try a sked? I set a goal for myself of confirming WAS in a year from getting my license and I have only a few weeks to go. I've gotten into ID on 80m, 20m and 10m. Will work CW (less than 15 WPM) or SSB. If you're interested, please repond to tjf@beta.lanl.gov.

Thanks!

If you have studied RF-EM radiation and its biological effects, you know that there are four factors that need to be considered (not withstanding the actual research methods - which is an entirely different subject) which are intensity, proximity, frequency, and length of exposure.

True that the hand-helds are 1/2 w, but the EM fields are much more intense (literally right against your skull). The police handhelds typically are the 'walkie-talkie' style and they have also learned to point the antenna away from the body (head in particular), thereby greatly reducing the field intensity. The EM field intensity has an inverse square relationship with proximity.

We have through research seen various effects on the body at various frequencies. Example, your microwave is set at a particular frequency that
will excite water molecules, thereby creating heat. At 27 Mhz (CB frequencies), the EM field has an affect on the sleep center of the brain. Exteremly low audio frequencies can, well let's just say can have an GI reaction.

The most critical factors, IMHO, is the length of exposure. The individual from Motorola on Eye-to-eye that claimed brain cancer from cell-phone use was also testing prototype antennas. I strongly suspect he spent hours per day on a cell-phone close to his head. Length of exposure is directly in the users control.

There was an intresting related story several months ago about how some police officers were developing prostrait (sp ?) cancer. They also linked it to a practice of removing the radar gun from its mounting on the exterior of the vechicle and keeping it between their legs (as to not alert motorists). They were using the equipment in direct contrdiction to the manufacturer's recommendations.

Measuring biological effects of RF-EM radiation is itself somewhat contriversal. The only agreed upon measurement (that I am aware of) is the change in temperature in tissue. It was shown in a seminar that I attended on the subject, that long term cell exposure will raise the brain tissue.

On the subject on research methods (which I know little about), here is a humorous happening tht illustraits the complexity of the problem. A group of researchers were studying the effects of RF on lab rats. They noticed when a particlar frequency was used, the rats would run wildly until they eventually sat in a water bowl. They concluded that this frequency had a effect on the rat's brain. Later in discussing their result, a radio engineer asked what the frequency was, and after doing some calculation, found the rat's tail was a perfect antenna for that frequency, hense, the tail was getting HOT !

There is much more that we don't know about RF-EM effects on biological systems than we do know. In the meantime, the best thing to do is not panic, not ignore, but use good ol' common sense.

There's no such thing as immunity to cancer. The correlation between low level RF exposure and cancer is weak at best, about 0.4 per 100,000 in the Milham study, and it had no controls for the other exposures that hams suffer from electronic chemicals, lead vapor, etc. Other studies have actually shown a *negative* correlation. And remember, correlation does not equal causation. No in vivo controlled laboratory data exists that shows any causation mechanism. There is some inconclusive evidence from in vitro studies, but in vitro results often don't translate one to one to in vivo results. There is very hard data, however, that exposure to field power densities greater than 10 mw/cm^2 cause health problems, not cancer, but rather things like cataracts. That's why you want to stay out of the near field of radiating objects.

>They mention that attic antennas are a no-no, and it appears mobiling
>douses your body with an rf field big time.

Attic antennas can be a problem, particularly if you are running significant power, but an antenna mounted in the center of the metal roof of a car shouldn't expose you to signifcant fields. A through the glass antenna, however, could make the entire passenger cabin hot with RF, I have actual measurement data to prove that. Another reason to avoid these poor performers.

>There is statistically significant cancer rates above the non-electronic
>population.

That's not clear at all. The Milham study shows a weak positive correlation, but other studies either show no correlation, or a negative correlation. The IBEW study of union electrical workers actually shows a negative correlation despite the fact that many electrical workers are also exposed to PCBs. Most of the studies of childhood leukemia increases depended on *calculated* exposure values. When control studies have been done with *measured* exposure values, the correlation goes away.

>What I want to hear out there is anyone who has done, or is knowledgeable
>of work done in this field...Let us know.

John Moulder produced the EMF faq for sci.med. While it deals mainly
with power line radiation, it points out the pitfalls of blindly accepting
some of the studies often cited as evidence of increased cancer risk.
I'm appending it to the end of this post.

Gary

#include faq

Power-Frequency Fields and Cancer (J. Moulder, v3, 22-Aug-93)

Notice: This FAQ sheet may be redistributed as long at remains correctly
attributed. If it is edited or condensed prior to redistribution, please add
a note to that effect.

1) Why is there a concern about power lines and cancer?

Most of the concern about power lines and cancer stems from epidemiological
studies of people living near distribution and transmission lines, and
epidemiological studies of people working in "electrical occupations". Some
of these epidemiological studies appear to show a relationship between
exposure to power-frequency fields and the incidence of cancer. Laboratory
studies have shown no link between power-frequency fields and cancer.

2) What's the difference between the electromagnetic [EM] energy associated
with power lines and other forms of EM energy such as microwaves or x-rays?

X-rays, ultraviolet (UV) light, visible light, infrared light, microwaves
(MW), radiowaves (RF), and magnetic fields from electrical power systems are
all parts of the EM spectrum. The parts of the EM spectrum are
characterized by their frequency or wavelength. The frequency and wave
length are related, and as the frequency rises the wavelength gets shorter.
The frequency is the rate at which the EM field changes direction and is
usually given in Hertz (Hz), where one Hz is one cycle per second.

Power-frequency fields in the US vary 60 times per second, so they are 60 Hz
fields, and have a wavelength of 3000 miles. Power in much of the rest of
the world is at 50 Hz. Broadcast AM radio has a frequency of around one
million Hz and wavelengths of around 1000 ft. Microwave ovens have a
frequency of about 2 billion Hz, and a wavelength of about 5 inches. X-rays
and UV light have frequencies of millions of billions of Hz, and wavelengths
of less than a thousandth of an inch.

3) What differences are there in the biological effects of these different
portions of the EM spectrum?

The interaction of biological material with an EM source depends on the
frequency of the source. We usually talk about the electromagnetic spectrum
as though it produced waves of energy. This is not strictly correct, because
sometimes electromagnetic energy acts like particles rather than waves; this
is particularly true at high frequencies. This double nature of the
electromagnetic spectrum is referred to as "wave-particle duality". The

particle nature of electromagnetic energy is important because it is the energy per particle (or photons, as these particles are called) that determines what biological effects electromagnetic energy will have.

At the very high frequencies characteristic of UV light and X-rays, electromagnetic particles (photons) have sufficient energy to break chemical bonds. This breaking of bonds is termed ionization, and this portion of the electromagnetic spectrum is termed ionizing radiation. At lower frequencies, such as those characteristic of visible light, radiowaves, and microwaves, the photons don't carry enough energy to break chemical bonds; but they do carry enough energy to cause molecules to vibrate, causing heating. These are called thermal effects, and this portion of the electromagnetic spectrum is termed the thermal, non-ionizing portion. Below the frequencies used in commercial broadcast radio (such as the 60 Hz frequencies generated in the production and distribution of electricity), the photons have insufficient energy to cause heating, and this portion of the electromagnetic spectrum is termed the non-thermal, non-ionizing portion.

4) What is difference between EM radiation and EM fields?

In general, EM sources produce both radiant energy (radiation) and non-radiant energy (fields). Radiated energy exists apart from its source, travels away from the source, and continues to exist even if the source is turned off. Non-radiant energy is not projected away into space, and it ceases to exist when the energy source is turned off. When a person or object is more than several wavelengths from an EM source, a condition called far-field, the radiation component of the EM fields dominates. In the far-field the electrical and magnetic components are closely related. When a person or object is less than one wavelength from an EM source, a condition called near-field, the field effect dominates, and the electrical and magnetic components are unrelated.

For ionizing frequencies where the wavelengths are less than thousandths of an inch, human exposure is entirely in the far-field, and only the radiation from the EM source is relevant to possible health effects. For MW and RF, where the wavelengths are in inches and feet, human exposure can be in both the near- and the far-field, so that both field and radiation effects are relevant. For power-frequency fields, where the wavelength is thousands of miles, human exposure is always in the near-field, and only the field component is relevant to possible health effects.

5) How does ionizing EM sources cause biological effects?

Ionizing EM radiation carries sufficient energy to break chemical bonds. In particular, ionizing radiation is capable of breaking bonds in the genetic material of the cell, the DNA. Severe damage to DNA can kill cells, resulting in tissue damage or death. Lesser damage to DNA can result in permanent changes in the cells which may lead to cancer. If these changes occur in reproductive cells, they can lead to inheritable changes, a phenomena called mutation. All of the known hazards from exposure to the ionizing portion of the EM spectrum are the result of the breaking of chemical bonds in DNA. For frequencies below that of UV light, DNA damage

does not occur. Well-accepted safety standards exist to prevent significant damage to the genetic material of persons exposed to ionizing EM radiation.

6) How do the thermal non-ionizing EM sources cause biological effects?

Visible light, MW, and RF can cause molecules to vibrate, causing heating. This molecular heating can kill cells. If enough cells are killed an organism will suffer a noticeable burn. Cells which are not killed by heating are normal when the heating ceases. All of the known hazards from exposure to the thermal non-ionizing portion of the EM spectrum are the result of heating. For frequencies below about the middle of the AM broadcast spectrum, this heating does not occur.

The molecular vibration caused by MW is how and why a MW oven works - exposure of the food to the microwaves causes water molecules to vibrate and get hot. MW and RF penetrate and heat best when the size of the object is close to the wavelength. For the 2450 MHz (2.45 billion Hz) used in microwave ovens the wavelength is 5 inches, a good match for most of what we cook.

7) How do the power-frequency EM fields cause biological effects?

The electrical and magnetic fields associated with power-frequency fields cannot break bonds or cause molecular heating. Thus the known mechanisms through which ionizing radiation, MW and RF effect biological material have no relevance for power-frequency fields.

The electrical fields associated with the power-frequency fields exist whenever voltage is present. These electrical fields have very little ability to penetrate buildings or even skin. The magnetic fields associated with power-frequency fields exist only when current is flowing. These magnetic fields are difficult to shield, and easily penetrate buildings and people. Because power-frequency electrical fields do not penetrate, any biological effects from routine exposure to power-frequency fields must be due to the magnetic component of the field.

Exposure of people to power-frequency magnetic fields results in the induction of electrical currents in the body. These currents are similar to naturally-occurring currents. It requires a power-frequency magnetic field in excess of 5 Gauss (see Q8 for typical exposures) to cause electrical currents of a magnitude similar to those that occur naturally in the body. Electrical currents that are above those that occur naturally in the body can cause noticeable effects, including direct nerve stimulation. Well-accepted safety standards exist to protect persons from exposure to power-frequency fields that would induce such currents (see Q16).

8) What sort of power-frequency magnetic fields are common in residences and workplaces?

In the US magnetic fields are commonly measured in Gauss (G). In the rest of the world, they are measured in Tesla (T), were 10,000 gauss equals 1 Tesla. Within the right-of-way (ROW) of a high voltage transmission line, fields can approach 100 mG (0.1 G, 100 microT). At the edge of a high-voltage ROW, the

field will be 5-25 mG. Ten meters from a 12 kV distribution line will be fields will be 2-10 mG. Actual fields depend on voltage, design and current. Fields within residences vary from over 1000 mG near certain appliances to less than 0.2 mG in the center of some rooms. Occupational exposures may exceed 10 Gauss (e.g., induction furnaces, arc welding), but exposures in the 10-50 mG range are more common.

9) What is known about the relationship between powerline corridors and cancer rates?

Some studies have shown that children (but not adults) living near certain types of powerlines (high current distribution lines and transmission lines) have higher than average rates of leukemia and brain cancers (Refs 1-3). The correlation is not strong, and none of the studies have shown dose-response curves. When power-frequency fields are actually measured, the correlation vanishes (not surprising, since the major source of power-frequency fields within most dwellings is inside the house). Several other studies have shown no correlations (Refs 4-6).

10) How big is the "cancer risk" associated with living next to a powerline?

The excess cancer found in epidemiological studies is usually quantified in a number called the relative risk (RR). This is the risk of an "exposed" person getting cancer divided by the risk of an "unexposed" person getting cancer. Since no one is unexposed to power-frequency fields, the comparison is actually "high exposure" versus "low exposure". Relative risks are generally given with 95% confidence intervals. These 95% confidence intervals are almost never adjusted for multiple comparisons even when multiple types of cancer and multiple indices of exposure are studied.

Taken together, using a technique known as "meta-analysis", the relative risks for the residential exposure studies are (adapted from ref. 7):
childhood leukemia: 1.3 (0.8 - 2.1) 5 studies
childhood brain cancer: 2.4 (1.7 - 3.5) 3 studies
adult leukemia: 1.1 (0.9-1.4) 2 studies
all adult cancer: 1.2 (0.8-1.6) 2 studies

11) What is known about the relationship between "electrical occupations" and cancer rates?

Several studies have shown that people who work in electrical occupations have higher than average leukemia, lymphoma, and brain cancer rates (refs 8-10). Most of the cautions listed for the residential studies apply here also: many negative studies, weak correlations, no dose-response curves. Additionally, these studies are mostly based on job titles, not on measured exposures.

Taken together, using a technique known as "meta-analysis", the relative risks for the occupational exposure studies are (adapted from ref. 7):
leukemia: 1.1 (1.0-1.2) 24 studies
brain: 1.2 (1.0-1.5) 16 studies
lymphoma: 1.2 (0.9-1.5) 6 studies
all cancer: 1.0 (0.9-1.1) 8 studies

12) What do laboratory studies tell us about power-frequency fields and cancer?

Power-frequency fields show none of the classic signs of being carcinogens - they do not cause DNA damage or chromosome breaks, and they are not mutagenic (refs 11-15). No studies have shown that animals exposed to power-frequency fields have increased cancer rates. On the other hand, numerous studies have reported that power-frequency fields do have "effects", particularly at high field strength (refs 16, 17). Even among the scientists who believe that there may be a connection between power-frequency fields and cancer, there is no consensus as to possible mechanisms (refs 16, 18).

There are agents that influence the development of cancer without directly damaging the genetic material. It has been suggested that power-frequency EMFs could either promote cancer or influence the progression of cancer. A promoter is an agent that increases the cancer risk in an animals already exposed to a genotoxic carcinogen. A progression effect would be one that increased the growth rate of an existing tumor. Promotion studies of power-frequency fields have been uniformly negative (refs 14, 19-21). Studies of progression have been mixed: 75% show no effects on tumor growth, while the rest are about equally mixed between studies showing increased growth and studies showing decreased growth (refs 11, 15, 20-22).

13) What about the new "Swedish" study showing a link between power lines and cancer?

There are new residential and occupational studies from both Sweden and Denmark. None have been published in full, but translations of the preliminary reports have been circulated.

- Fleychting & Ahlbom [Magnetic fields and cancer in people residing near Swedish high voltage powerlines]. A case-control study of everyone who lived within 300 meters of high-voltage powerlines between '60 and '85. For children all types of tumors were analyzed, for adults only leukemia and brain tumors were studied. "Exposure" was assessed by spot measurements, calculated retrospective assessments, and distance from powerlines. No increased overall cancer risk was found for either children or adults. An increased risk for leukemia (but not other cancers) was found in children for *calculated* fields at the time of diagnosis. No significantly elevated cancer risks were found for measured fields or proximity to powerlines.

- Olsen and Nielson [Electromagnetic fields from high-power electricity transmission systems and the risk of childhood cancer]. Case-control study based on all childhood leukemia, brain tumors and lymphomas diagnosed in Denmark between '68 and '86. "Exposure" was assessed on the basis of calculated fields over the period from conception to diagnosis. No overall increase in cancer risk was found, but the risk of lymphoma was elevated. No increase in childhood leukemia or brain cancer was found.

- Guenel et al. [Cancer incidence among Danish persons who have been exposed to magnetic fields at work]. Case-control study based on all cancer in actively employed Danes between '70 and '87 who were 20-64 years old in 1970. Each occupation-industry combination was coded on the basis of supposed 50-Hz

magnetic field exposure. No significant increases in risk were seen for breast cancer, malignant lymphomas or brain tumors. Leukemia incidence was elevated among men in the highest "exposure" category; women in similar exposure categories showed no excess risk.

-Floderus et al [Occupational exposure to EM fields in relation to leukemia and brain tumors]. Case-control study of leukemia and brain tumors of men, 20-64 years of age in '80. "Exposure" calculations were based on the job held longest during the 10-year period prior to diagnosis. Many measurements were taken using a person whose job was most similar to that of the person in the study. About two thirds of the subjects in the study could be assessed in this manner. A significantly elevated risk was found for leukemia, but not for brain cancer.

14) How do scientists evaluate all the confusing and contradictory laboratory and epidemiological studies of power-frequency magnetic fields and cancer?

There are certain widely accepted criteria that are weighed when assessing such groups of studies. These are the Hill criteria (ref. 23).

- First, what is the *strength of the association* between exposure and risk; is there a clear risk associated with exposure? A strong association is one with a RR (see Q9) of 5 or more. Tobacco smoking, for example, shows a RR for lung cancer of 10-30 times that of non-smokers.

Most of the positive power-frequency studies have RRs of less than two. The leukemia studies as a group have RRs of about 1.2, while the brain cancer studies as a group have RRs of about 2. This is only a weak association.

- Second, are there many *consistent studies* indicating the same risk; do most studies show about the same risk for the same disease? Using the same example, essentially all studies of smoking and cancer showed an increased risk for lung and head-and-neck cancers.

Many power-frequency studies show statistically significant risks for some types of cancers and some types of exposures, but many do not. Even the positive studies are inconsistent with each other. For example, while a new Swedish study shows an increased risk for childhood leukemia for one measure of exposure, it contradicts prior studies that showed a risk for brain cancers, and a parallel Danish study shows a risk for childhood lymphomas, but not for leukemia. Many of the studies are internally inconsistent. For example, where the Swedish study shows an increased risk for childhood leukemia, it shows no overall increase in childhood cancer, implying that the rates of other types of cancer are decreased. In summary, few show the same positive result, so that the consistency is quite weak.

- Third, is there evidence for a *dose-response relationship*; does risk increase when the exposure increases? Again, the more a person smokes, the higher the risk of lung cancer.

No power-frequency exposure studies have shown a dose-response relationship between measured fields and cancer rates, or between distances from

transmission lines and cancer rates. The lack of a relationship between exposure and increased cancer risk is a major reason why many scientists are skeptical about the significance of the epidemiology.

- Fourth, is there *laboratory evidence* suggesting that there is a risk associated with such exposure? Epidemiological associations are greatly strengthened when we have laboratory evidence for a risk. When the US Surgeon General first stated that smoking caused lung cancer, the laboratory evidence was ambiguous. We knew that cigarette smoke and tobacco contained carcinogens, but no one had been able to make lab animals get cancer by smoking.

Power-frequency fields show none of the effects on cells, tissues or animals that point towards their being a cause of cancer, or to their contributing to cancer.

-Fifth, are there *plausible biological mechanisms* that suggest that there should be a risk? If we understand how something causes disease, it is much easier to interpret ambiguous epidemiology. With smoking, for example, the fact that there were known cancer-causing agents in tobacco made it very easy to believe the epidemiology.

>From what we know of power-frequency fields and their effects on biological systems we have no reason to even suspect that they pose a risk to people at the exposure levels associated with the generation and distribution of electricity.

- Overall the evidence for a connection between power frequency fields and cancer is at most weak, because of the weakness and inconsistencies in the epidemiological studies, combined with the lack of a dose-response relationship in the human studies, and the negative laboratory studies

15) What are some good overview articles?

A very good review of the area has just been published by Oak Ridge Associated Universities. It is titled "Health Effects of Low-Frequency Electric and Magnetic Fields". It costs $25 and is available from National Technical Information Service (ARAU 92/F-8) and the US Government Printing Office (029-000-00443-9). If you're in the U.K., a good review is: R Doll et al, Electromagnetic Fields and the Risk of Cancer, National Radiation Protection Board, Chilton, 1992. Another good review is MN Bates, "Extremely low frequency electromagnetic fields and cancer: the epidemiologic evidence", in Environmental Health Perspectives 95:147-156, 1991.

16) Are there exposure standards for power-frequency fields?

Yes, a number of governmental and professional organizations have developed exposure standards. These standards are based on keeping the body currents induced by power-frequency EM fields to a level below the naturally occurring fields. The most generally relevant are:

- Guidance as to restriction on exposures to time varying EM fields and the 1988 recommendations on the International Non-Ionizing Radiation Committee, National Radiation Protection Board, Chilton, 1989.
50/60 Hz E-field: ~10 kV/m (freq. dependent)
50/60 Hz H-field: 1630 A/m, 2 mT (20 G)

- Sub-radiofrequency (30 KHz and below) magnetic fields, In: Documentation of the threshold limit values, American Committee of Government and Industrial Hygienists, pp. 55-64,1992.
At 60 Hz: 1 mT (10 G); 0.1 mT (1 G) for pacemaker wearers

- HP Jammet et al: Interim guidelines on limits of exposure to 50/60 Hz electric and magnetic fields. Health Physics 58:113-122, 1990.
*H-field (rms)
24 hr general public: 0.1 mT = 1 G
Short-term general public: 1 mT = 10 G
Occupational continuous: 0.5 mT = 5 G
Occupational short-term: 5 mT = 50 G
*E-field (rms)
24 hr general public: 5 kV/m
Short-term general public: 10 kV/m
Occupational continuous: 10 kV/m
Occupational short-term: 30 kV/m

Sure, anything is possible. It is highly illegal though for hams to be
broadcasting in the frequency band mentioned. As a matter of fact, hams
are not allowed to broadcast (transmit with the intent of the general
public to be the audience) period, except under very specific circumstances,
such as code practice in the ham bands, and maybe shuttle audio. Why do you
ask?

Sure it's *possible*, illegal as hell though, and the narrow band FM
used by ham rigs wouldn't sound very good on the wide band FM receivers
of broadcast listeners.

I may be way off here---I'm not sure exactly what you're after. If you're looking for something that helps when multiple people are involved in a single conversation, say on some BBS with a conferencing bridge, etc., then I've got nothing for you. :-(

If, however, you're looking for something that does this for ``normal'' packet use, and you just want each active stream in its own window, as well as another window for monitor output, you might want to get with me about KAMterm. It isn't a Windows program---it's plain text mode, but it does have multiple windows (each active stream has its own window, and each of these takes up lines 0-20, or something like that..., of the screen). KAMterm is currently only available for dos, but I'm slowly but surely working on a UNIX version.

207. Power Lines Cause Cancer? Maybe Not...

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-11 16:20:12 UTC
From: peterson@physc1.byu.edu
Message-ID: <1994Jan11.092012.1257@physc1.byu.edu>
Source record: 272522

Recently an interesting article came across the "What's New" feed from the American Institute of Physics (3 Dec 93 issue). To quote part of item 3:

"Just last month (What's New, 5 Nov 93), we reviewed 'The Great Power-Line Cover-up.' Now it appears that Finland has joined the cover-up! The Finns, it seems, are obsessive about keeping records, making it possible to calculate the exposure levels of children living near power-lines amounting to one-million person years! In the whole cohort of 134,800 children there were 140 cancers, 5 less than expected. The only increased risk was for nervous system tumors among boys, but even that was attributed to one boy who had 3 tumors."

I don't think this study ever made the news (doesn't fit the agenda of the news media establishment) and there is no reference to where the study was published. However, it does indicate that living next to power-lines (at least Finnish power-lines) may actually reduce the incidence of cancer. Maybe there is something different about power-lines in Denver that causes increased cancer (the original study) other than a difference in frequency (Finland does use 50 Hz like the rest of Europe don' they?).

Just food for thought.

Bryan Peterson

BARTG * GB2ATG * NEWS * BARTG * NEWS * GB2ATG * BARTG
This is the - British Amateur Radio Teledata Group - News Broadcast Service for all Amateurs and Short Wave Listeners interested in RTTY Amtor, Pactor and Packet Radio.

This news is broadcast during the first full week commencing Monday each month, to the following schedule..

Evening transmissions at 1930 GMT. on 3.584 MHz. Mark. +/- for QRM.
RTTY on Monday-AFSK, Wednesday-AFSK, and Friday-FSK.
Pactor-FEC on Tuesday.
Amtor-FEC on Thursday and Saturday.

Morning transmission at 1000 GMT. on 7.041 MHz. Mark. +/- for QRM.
RTTY on Sunday-AFSK.

An edited version of this bulletin is available on the Packet network as a BARTG @ GBR. file thanks to: Andy (G3ZYP) @ GB7MXM.#36.GBR.EU.

It is also posted on the "INTERNET" system via the INFO-HAMS list on UCSD.EDU. thanks to Iain (G6ARO) who is available on the "JANET" network as Iain @UK.AC.HUMBER.

News for January 1994. Bulletin No. 013. (all times are GMT).

BARTG Information.

GB2ATG editor would welcome 2 more volunteer transmit stations for 3.5 MHz. on week-day or Saturday evenings. Bulletins are supplied on disk to almost any IBM compatible format so no typing required. I would particularly welcome an offer from the North of England or Scotland to serve that geographical area. Please write or telephone for further details to: Bob (G0ARF).

RTTY DX Activity.

The HF bands have not been in very good shape over the last month but several short openings provided the following:

14 MHz.
FK8GS and ZL1KN 0730, CN8NP 0800, ZL1SY, LU2ATR and BY1QH 0830,
VK2RT 0900, IC8BNK 1000, VP9/WB2RAJ 1230,
VK5GY, S51GL and 4L8A 1400, A43YY and VQ9WL 1430,
VQ9TV, EA6MQ and UJ8JCQ 1500, TK5ML 1530,
CH2STN and J28JJ 1600, 9M2MW 1630,

21 MHz.
CU3EM 1100, CU1AC and LU2DGO 1600,

14 MHz Pactor.
7Z1AB 1400, HS1ASC 1600.

QSL Information.
VP9/WB2RAJ to home call. 4L8A (Tblisi, Georgia) via OZ1HPS.
CH2STN was on Jesus Isl, a Canadian PQ14 area contest site.
QSL via VE2STN.

Contests.
The Spanish EA-RTTY contest starts 1600 February 12 until 1600 February 13 on all 5 HF bands 80 through 10 meters.
Four classes:
A) Single operator all band.
B) Single operator single band.
C) Multi operator all band.
D) Short Wave Listener.
Exchange for EA stations is RST plus "Prefijo Provincial" (52 total) eg. - B, M, PM, VA, etc. All others give RST plus CQ zone.
Copies of rules and sample log sheets from the editor if sase enclosed.
Deadline for logs 15th April 1994 to:
EA RTTY contest manager. (EA1MV). Antonio Alcolado, P.O. Box 240, 09400 Aranda de Duero (Burgos), Spain.

Notes of interest.
The long awaited DX-Pedition to Peter 1st Island (3Y) should be QRV all bands and modes from February 1 through 14. KYFC.

(IC8BNK) is on the Isle of Capri, IOTA EU-031.

Peter (XT2BW) takes 2 months leave in Ghana from the end of January. He hopes to obtain a license and be QRV (9G) when time permits. We all hope to get some RTTY from him following his splendid service from Burkina Faso.

(A43YY) was operating from the Royal Omani Amateur Radio Field Day camp.

DXCC. The ARRL Awards Committee voted 6 for 1 against accepting the ARRL DX Advisory Committee (DXAC) recommendation to create an Honour Roll for RTTY DXCC. Qualification for the new Honour Roll is the same as for Mixed Honour Roll. This move makes it possible to achieve DXCC Honour Roll "All RTTY" for the first time.

Good news from Nikos (SV2WT) that Monk Apollo is active again on the HF bands as (SV2ASP/A) from Mount Athos. With equipment provided by Minoru JA3MNP and other JA stations, we all hope to find Mount Athos QRV RTTY in the coming months.

Thanks this month to:.
G3ZYP, DXNS, OPDX/BARF80.

BARTG caters for all DATA interests with information-components-kits -ready built units and software from experts. Members receive a 120 page quarterly journal devoted to data modes. Beginners guides for most data modes are available. The group sponsors HF and VHF RTTY contests, administers its own DX and members award scheme and runs an annual rally.

This copy of BARTG News is posted by Iain Kendall (G6ARO) who can be contacted via Internet e-mail at.. iain@humber.ac.uk Items for inclusion in the broadcast may also be mailed to this address, as well as any queries regarding membership or services offered by BARTG.

Copy of the news as distributed by G0ARF 931229

210. Re: Ramsey kits not too good

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-11 16:46:38 UTC
From: doc@webrider.central.sun.com
Message-ID: <2gul5eINNt6j@cronkite.Central.Sun.COM>
Source record: 272499

Just to mix up the pot abit more - Just talked with a local ham
who bought and put together the Ramsey 2 meter amplifier kit. He
was on the air with it last night and sounded very good. I asked
him if he had run into any problems with construction, design etc.
and he claimed it came up and worked the first time. He was very
happy with it. His total cost (kit + case & misc.) came to just
under $50.

Now I understand that this design is much less complex than building
a transceiver, but it sounds like you need to pick and choose which
kits to buy, and which to avoid.

73,

Steve

Source record: 272510

In article <1994Jan11.144946.25480@brtph560.bnr.ca> cnc23a@b4pph13e.bnr.ca (Ken Edwards) writes:
>We have through research seen various effects on the body at various
>frequencies. Example, your microwave is set at a particular frequency that
>will excite water molecules, thereby creating heat.

This is a common misconception and one that needs to be corrected, especially in regard to a discussion on how radio waves interact with living cells.

The lowest resonant absorption frequency for water (rotational spectra) is 22.235 GHz. Home microwave ovens in the United States operate at 2.45 GHz. Industrial ovens often use 916 MHz. In Europe, other frequencies are often used such as 433.9 and 896 MHz (UK), 2.375 GHz (former USSR), 3.39 GHz (Netherlands), etc. None of these frequencies specifically excite water molecules. Water has a high dielectric constant and high dielectric losses from low frequencies to well into the microwave region (8 to 18 GHz depending on many factors). Many other materials also are good absorbers of microwave energy in this part of the spectrum: ethanol (drinking alcohol), methanol (Wood alcohol), acetone (fingernail polish remover), ethylene glycol (antifreeze), etc. Ice, however, is a relatively poor absorber of microwaves. Many plastics such as Nylon and ceramics such as Steatite are also good microwave absorbers at elevated temperatures (in fact Nylon and Steatite can undergo thermal runaway). The frequency of 2.45 GHz was chosen by international agreement. It is a reasonable compromise of a number of factors: magnetrons are relatively inexpensive for this part of the spectrum, the absorption of most foods is high at this frequency yet not so high that penetration becomes a problem, and the dimensions of a multimode cavity cooking chamber are reasonable for most kitchens.

A good reference on how microwaves interact with materials is "Microwave Spectroscopy" by Townes and Schawlow. [This is the same Charles Townes of maser and laser fame.] A more practical reference is "Industrial Microwave Heating" by Metaxas and Meredith. I believe both of these books are still in print.

212. Recent Ham Innovation

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-11 17:14:52 UTC
From: brian@positron.amd.com
Message-ID: <CJH6Ks.MBL@dvorak.amd.com>
Source record: 272517

In the January 1994 issue of IEEE Spectrum (the IEEE's general circulation magazine) was a note of interest to amateurs on page 24:

There is also a class of Non-Voice Non-Geostationary (NVNG) Mobile Satellites Services -- LEO satellites operating below 1GHz that have come to be known as "Little LEO" systems. On Nov. 16, they were allocated spectrum in the 150- and 400MHz bands. [....]

The NVNG service, based on technology pioneered by radio amateurs, will be used for brief data messages, monitoring and control of remote industrial, agricultural, and natural resource facilities, and consumer alarm, electronic mail, and vehicle location. Launches of the first NVNG satellites are expected later this year.

(The above is quoted, typos are probably mine...)

PKGold (for AEA TNCs) and KAGOLD (for Kantronics) do a fantastic job in this
area. They allow for multiple packet connects, keeping each separate from
the other, monitoring of traffic on the frequency, and if dual port TNC, the
ability to run HF on the other side, all at the same time.

>Thanks and Best 73's Bill--AA5ZQ.

I can't speak for the newer ones that you mentioned, however, the old Magnus (now sold under the name Metron) is bullet-proof. I have a blind friend who has been running one for 15 years. He has run it with no antenna, the wrong antenna, bandswitched to the wrong band, all without a failure. He really abuses it, not on purpose, it just happens. All you have to do is come up with a 100a 12v supply and it talks! I have a trucker friend who runs one from his truck all the time and he also likes his.

Good luck,
Gary - AG0N

Don't do this. the Funny Cookie Corporation goes after unlicensed broadcasters
and issues fines as big as $20K. And they might take your amateur license,
too.

220. Re: BRAIN CANCER, LEUKEMIA FROM HAM RADIO

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-11 18:11:30 UTC
From: rdewan@casbah.acns.nwu.edu
Message-ID: <2guq4i$m3t@news.acns.nwu.edu>
Source record: 272514

In article <1994Jan11.150658.25191@ke4zv.atl.ga.us>,
Gary Coffman <gary@ke4zv.atl.ga.us> included a FAQ on radiation.

Thanks for including it Gary. I enjoyed reading it and learnt a lot
from it. The following paragraph about microwave ovens caught my attention:

>The molecular vibration caused by MW is how and why a MW oven works -
>exposure of the food to the microwaves causes water molecules to vibrate and
>get hot. MW and RF penetrate and heat best when the size of the object is
>close to the wavelength. For the 2450 MHz (2.45 billion Hz) used in
>microwave ovens the wavelength is 5 inches, a good match for most of what we
>cook.

And I thought that this frequency was picked because it was close to
a resonant frequencty of the O-H bond present in water, sugars and fats -
common though often undesired components of what we eat.

HORSE-FROCKEY !!! If someone wants to find a repeater's location for
mischevious purposes he can find it using simple direction finding
techniques used by 'Fox-Hunters'. A 30 minute process usually.

>
>At lease in the cas of the Texas VHF-FM Society, lat/lon/HAAT data is

>confidential, we wouldn't get the data either.
>--

More BS.... The REAL reason this information isn't given out is that
Cordination Groups want to wield their coordination POWER without
fear of any questioning their declarations. With all the data on
a repeater (lat/lon/haat/erp , etc) you could challenge or even
ignore their refusal to coordinate a repeater on a frequency you
have chosen. I suspect less than 1% of the so called coordinated
repeaters in operation today have any sort of REAL engineering
study including contour maps done on them. Most have been 'coordinated
' by either first come first served ---- or Good Ole Boys Network
methods.

This information is publicly available for EVERY commercial radio
and televion station in the USA and there is absolutely no reason other
than small minded POWERMONGERING politics that this isn't available
for amateur repeaters.

I dare ANY so called coordinating group to prove me wrong by PUBLISHING
there engineering studies for all their "coordinated" repeaters.

All we'll probably hear is eithe silence or a crescendo of flames
about how their "integrity " has been insulted....but the engineering
studies generally don't exist so we will never see them!

222. Any interest in X Logging Program?

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-11 18:19:57 UTC
From: cmoore@mothra.rose.hp.com
Message-ID: <2guqkd$7k5@hpchase.rose.hp.com>
Source record: 272519

Hi all,

I'm starting to work on a logging program which will run on a unix workstation running the X11 windowing system. I realize that most people don't have X11 workstations and radios in the same place, but I thought maybe somone out there might be interested. It will support interface to an Icom radio as well as logging and awards tracking.

Is there any interest in this? I'd be happy to give out copies once it is done. Also, are there any suggestions or requests as to what you'd like it to do? For example, I could probably add code to talk to other radios but I would need details on how they work...I only have an Icom.

If you would are interested in the program and/or have suggestions, send me mail at cmoore@mothra.rose.hp.com and let me know. I'll try to incorporate as many suggestions as I can. I also may need help with beta testing, particularly if I add support for radios I don't have.

If the response is overwhelming I'll probably just find an FTP site that I can put it on to make it available. If the response is non-existant I'll just go off and use it myself. :-)

225. Repeater Purposes

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-11 19:22:48 UTC
From: jackson@longlast.cs.nyu.edu
Message-ID: <2guua8$6op@slinky.cs.nyu.edu>
Source record: 272527

I am interested in hearing from people who run or utilize special purpose repeaters or simplex freqs. For example, I've heard mention of commuter nets, particularly in the Bay Area. Are they regular nets that just happen to be populated by commuters most of the time or did the area coordinators decide 146.880 (or whatever) to be the "Commuter Channel".

I would be interested in a traffic notification net. For instance, during rush hours, the majority of the calls would be traffic hotspots or drivers requesting conditions from drivers along a certain route or on a roadway tens of miles away. Perhaps even autopatch to make it easier for more people to make calls for assistance. The level of professionalism would certainly be an improvement over CB.

I was following a QSO a while ago on 2m when one of the conversants stated in the middle of the conversation, "I wonder if anyone on the channel can tell me how the George Washington Bridge is doing." He received a reply rather quickly, and I got to thinking that maybe a repeater just for those types of calls would be appreciated. Lots of backups could be avoided if some of us only knew to steer well clear of an accident twenty miles down the road.

Just a thought.

None of the other respondents mentioned that it is perfectly legal to broadcast on the FM broadcast band using very low power. You can buy "wireless microphones" and other devices with a range of a couple hundred feet or so.

Al you are correct, I did not mention low power. IF you use less then 100mw and
a antenna for less then 5' in length then I beleive that it is legal. I thought
that a higher power was implied though.

231. Alpha Bravo Charlie Delta: phonetic alphabets (revised)

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-11 20:38:56 UTC
From: bck1@cl.cam.ac.uk
Message-ID: <1994Jan11.203856.20421@infodev.cam.ac.uk>
Source record: 272379
Cross-posted to: alt.usage.english,sci.lang,rec.radio.amateur.misc,rec.radio.info

Alpha Bravo alphabets

Here is a collection of alphabets of the Alpha Bravo Charlie Delta kind, variously known as radio alphabets, phonetic alphabets and spelling alphabets. This collection currently includes alphabets for the following languages:

English, French, German, Dutch, Flemish, Italian, Rumantsch, Slovak, Polish, Hungarian, Swedish, Finnish and Russian.

This posting supersedes the one of 10th December.

My thanks to the many contributors, not all of whom are acknowledged below.

I can make no guarantee of accuracy of this information; indeed please send me any corrections or additions.

Comments in square brackets are my own.

Brian Kelk bck1@cl.cam.ac.uk
11 January 1994

***** ENGLISH *****

The NATO phonetic alphabet:

Alpha Bravo Charlie Delta Echo Foxtrot Golf Hotel India
Juliet Kilo Lima Mike November Oscar Papa Quebec Romeo
Sierra Tango Uniform Victor Whiskey Xray Yankee Zulu

[The same alphabet, modulo Alfa and Juliett, is approved by the International Civil Aviation Organization and the FAA. Dates from about 1956.
UK police use Indigo instead of India (?)]

Telecom B:

Alfred Benjamin Charles David Edward Frederick George Harry Isaac Jack King London Mary Nellie Oliver Peter Queen Robert Samuel Tommy Uncle Victor William Xray Yellow Zebra

[Found in Swedish, Dutch, Hungarian telephone directories. A Swiss directory has: Andrew Charlie Lussy Queenie Sugar]

British A:

Amsterdam Baltimore Casablanca Denmark Edison Florida
Gallipoli Havana Italia Jerusalem Kilogramme Liverpool
Madagascar New_York Oslo Paris Quebec Roma Santiago Tripoli
Uppsala Valencia Washington Xantippe Yokohama Zurich

[An 'international' alphabet in a Dutch telephone directory
has: Danemark. A 'French' alphabet in a Hungarian directory
has: Cassablanka Danemark Que'bec Upsala Zu"rich]

Used (still?) by New York police:

Adam Boston Chicago Denver Edward Frank George Henry Ida
John King Lincoln Mary Nancy Ocean Peter Queen Robert Sam
Thomas Union Victor William X-ray Young Zebra

Used by police in San Diego, California:

Adam Boy Charles David Edward Frank George Henry Ida John
King Lincoln Mary Nora Ocean Paul Queen Robert Sam Tom Unit
Victor William Xray Yellow Zebra

Sometimes used by radio hams (unofficial):

America Boston Canada Denmark England France Germany
Honolulu India Japan Kilowatt London Mexico Norway Ontario
or Ocean Pacific Quebec Radio Santiago or Spain Tokyo United
Victoria Washington Xray Yokohama Zanzibar

[Much variation: Amsterdam, Brazil, Baltimore, Chile,
Finland, Greece, Guatemala etc]

The ARRL (American Radio Relay League) alphabet (1948):

Adam Baker Charlie David Edward Frank George Henry Ida John
king Lewis Mary Nancy Otto Peter queen Robert Susan Thomas
union Victor William x-ray young zebra

[Nowadays the ARRL endorses the NATO/ICAO alphabet]

Allied Services 1945:

Able Baker Charlie Dog Edward Fox George How Item Jig King
Love Mike Nan Oboe Peter Queen Roger Sugar Tape Uncle Victor
William X-ray Yoke Zebra

From a book entitled "The Complete Morse Instructor..." (1944):

able baker charlie dog easy fox george how item jig king
love mike nan oboe peter queen roger sugar tare uncle victor
william x-ray yoke zebra

[This one seems to have undergone quite a lot of evolution,
with different branches of the U.S. armed forces using
different versions. Entries also cited: affirm, cast, hypo,
inter, negat, option, over, prep]

Western Union:

Adams Boston Chicago Denver Easy Frank George Henry Ida John
King Lincoln Mary New_York Ocean Peter Queen Roger Sugar
Thomas Union Victor William X-ray Young Zero

British Army 1927:

Ack Beer Charlie Don Edward Freddy George Harry Ink Johnnie
King London Monkey Nuts Orange Pip Queen Robert Sugar Toc
Uncle Vic William X-ray Yorker Zebra

Royal Navy 1917:

Apples Butter Charlie Duff Edward Freddy George Harry Ink
Johnnie King London Monkey Nuts Orange Pudding Queenie
Robert Sugar Tommy Uncle Vinegar Willie Xerxes Yellow Zebra

U.S. Army 1916:

Able Buy Cast Dock Easy Fox George Have Item Jig King Love
Mike Nap Opal Pup Quack Rush Sail Tape Unit Vice Watch X-ray
Yoke Zed

On world.std.com, there is a C program for code in the directory:
pub/hamradio/unix called superiormorse.shar.

For DOS, there is always Super Morse, as well as others.

233. Re: Repeater database?

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-11 20:57:58 UTC
From: bwilkins@iat.holonet.net
Message-ID: <CJHGwo.8Lu@iat.holonet.net>
Source record: 272386

clifto@indep1.UUCP (Cliff Sharp) after my editing writes:

: HAAT, on the other hand, provides clues that might be better left
: unpublished...

HAAT is height above average terrain. The repeater I use is about 2000'
above sea level. The HAAT is about 450'. This happens when there are
taller hills within ten miles. Repeaters located in mountain valleys may
have mountains towering around them and will often times show a calculated
HAAT of - 200' as the repeater is 200' below the average terrain of the
ten mile circle around the repeater. This does not mean the repeater does
not get out vary far....propagation and defraction over the local terrain
may allow this -200' repeater to cover over 100 miles.

This only works in mountainous areas...don't try this from the bottom of a
200' pit in flat country ;)

HAAT is just a calculation that attempts to even out the playing field.

So I'll throw my two cents in. Having built a couple of things from
Hamtronics (a voice-ID board and a 70cm, 30W amp) I must say that the
voice-id'er was ok, but the amp absolutely sucked. Never never never buy
anything from Hamtronics in kit form. It's not worth the headache. Then
again, so is their pre-built stuff too.

From: mercer@dgs.dnd.ca
Message-ID: <2gv7jp$3e0@netfs.dnd.ca>
Source record: 272385
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I am an avid climber/backpacker etc and want to be able to use my HT in the backcountry. I require a design for an antenna (with better gain than my rubber duck) that is light, easily packable, and not too bulky, which will allow me to work repeaters in the 2m band. In case it matters, most (but not all) of the use will be from mountain tops.

Obviously, a 1/2 wave diapole is a candidate but I was wondering if there are any others?

How about a boom that can be disassembeled? A flexable J pole? I would appreciate any and all suggestions.

Thanks
DAve

Do those "Mr. Microphone" products transmit in the FM broadcast band? Do those products have to be "type accepted", or is just a matter of limiting transmission power and signal type? Also, don't those "spy" transmitters radiate in the FM broadcast band? Is it just a matter of not transmitting under the authority of an Amatuer radio license?

mikewood@rock.concert.net (W. M Wood -- The Signal Group)after editing writes:
:
: More BS.... The REAL reason this information isn't given out is that
: Cordination Groups want to wield their coordination POWER without
: fear of any questioning their declarations. With all the data on
: a repeater (lat/lon/haat/erp , etc) you could challenge or even
: ignore their refusal to coordinate a repeater on a frequency you
: have chosen.

Should be quite easy to challenge your coordinating body with an
engineering study. The easiest amateur method is to draw a line on a map
of the usable coverage area of the adjacent repeater as it relates to your
proposal. You know that the good ole boys got to you when the line changes
;) Bare in mind there should not be any overlap of significant magnitude.

: I suspect less than 1% of the so called coordinated
: repeaters in operation today have any sort of REAL engineering
: study including contour maps done on them. Most have been 'coordinated
: ' by either first come first served ---- or Good Ole Boys Network
: methods.
:

The Motorola Engineering Study for our hilltop shows their mobile coverage
the same as our portable less than 5 watt contour. Of course the mobile
coverage of our repeater is significantly greater.

: This information is publicly available for EVERY commercial radio
: and televion station in the USA and there is absolutely no reason other
: than small minded POWERMONGERING politics that this isn't available
: for amateur repeaters.

I think you are confused with the licence information available from the
FCC . An engineering study is only a tool to be used with caution.
Depending on the formulas used for the computed contures I have seen five
different contours for our repeater. Several of the programs fail to
enclude diffraction. We know our repeater plays over hills and can be
enhanced by ridge lines into areas that do not show up in your typical
engineering study.

:
: I dare ANY so called coordinating group to prove me wrong by PUBLISHING
: there engineering studies for all their "coordinated" repeaters.
:

No need to publish a study....You can drive the contour yourself, It
should be obvious even to an amateur. When you are on the edge you know it.

The edge does not change from day to day...you know how far up route 123
the repeater will work.

: All we'll probably hear is eithe silence or a crescendo of flames
: about how their "integrity " has been insulted....but the engineering
: studies generally don't exist so we will never see them!
:

I am sure you are right.....

Not to pick on Ramsey in particular, but the Part 97 requirements
for spectral purity between 50 and 225Mhz are stringent enough to
make me put *any* RF emitting device for these frequencies on a
spectrum analyzer before putting them into service.

The subjective "I tried it and it worked" test for RF amplifiers
and transmitters does not take into account the possibility of
illegal levels of spurious and harmonic output.

Unfortunately publication 432 is out of date here. The nets don't work this way anymore, and haven't since the late 1970s, as has been noted previously in this thread. Using broadcast colorburst will only give you a reference that's the local crystal oscillator at the local broadcast outlet. It's likely no more accurate than your own crystal oscillator, about 4 ppm. NIST should circulate a retraction of this technique because it's likely still misleading folks. (They may have issued one, but I haven't seen it.)

That's true. The faq is saying two separate things here. First it's
noting that 2.45 GHz excites water molecules. And second it's saying
that an object tends to absorb RF best when the wavelength, actually
half wavelength, matches the size of the object. That's because
maximum E (or H) field difference is developed across it.

Note: 2.45 GHz is *not* a resonant frequency for water molecules,
but water does absorb significantly at this frequency.

Obviously a roled up twinlead J-pole will offer better performance than
the rubber dummy load, and it's easy to carry in the pack. However, if
you're really in the back country, a collapsable beam will be much better.
Simple designs based on folding elements from common TV antennas are
available. You can slip the folded antenna into a PVC tube and use that
as a walking stick. When you're ready to operate, the PVC can double as
a short mast.

David Mercer (mercer@dgs.dnd.ca) wrote:
: I am an avid climber/backpacker etc and want to be able to use my HT in
: the backcountry. I require a design for an antenna (with better gain
: than my rubber duck) that is light, easily packable, and not too bulky,
: which will allow me to work repeaters in the 2m band. In case it
: matters, most (but not all) of the use will be from mountain tops.

: Obviously, a 1/2 wave diapole is a candidate but I was wondering if
: there are any others?

: How about a boom that can be disassembeled? A flexable J pole? I would
: appreciate any and all suggestions.

I'd recommend an AEA Hot Rod (tm) antenna or similar.
Its a half-wave vertical (so no ground radials required) that
fits onto an HT BNC, telescopes down to about 8 inches long.
(There's one laying somewhere on the Continental Divide Trail,
where I dropped it.:-)

2nd choice is a j-pole made out of TV twinlead. Not really that
great unless there are usually trees around to hang it in.
Even then its probably too much hassle for the hiking/backpacking
scenario.

There are beams that disassemble, but unless you really need the
few dB of gain and are going to stay put for a while, I'd say
they are too much hassle as well.

NOTE: The Effective Sunspot Number for 10 JAN 94 was 60.4.
The Full Kp Indices for 10 JAN 94 are: 2- 1- 1o 1o 2- 1- 1+ 1o

SYNOPSIS OF ACTIVITY

Solar activity was low. Region 7648 (N07W37) produced
several small C-class flares. This region, and abutted Region
7650 (N05W27) were generally stable. The trailer of 7648 is
intruding upon the leader of Region 7650 creating high magnetic
gradients there.

Solar activity forecast: solar activity should be very
low to low. An isolated M-class flare remains a possibility
from the 7648/7650 complex.

STD: A full-disk Yohkoh x-ray image has been appended to this
report, showing the position of the coronal hole and the

strong, broad emissive area covered by departed Regions 7646 and 7645. It is interesting to note that intense Fe X emissions were also observed from these regions as they departed the west limb, in addition to the moderate Ca XV emissions reported earlier.

The geomagnetic field was quiet to unsettled until approximately 1500Z when the field became disturbed. Mid latitudes went to active to minor storm levels. Some high latitude sites experienced major to severe storm conditions. The coronal hole in the southwest is the likely source of this disturbance. The time of onset is slightly earlier than expected.

Geophysical activity forecast: the geomagnetic field should be at active to minor storm levels for 12 Jan. Local nighttime sectors could experience major storm conditions. Near active levels are forecast for 13-14 Jan with some minor storm periods possible during that time.

Event probabilities 12 jan-14 jan

Class M 20/20/20
Class X 05/05/05
Proton 05/05/05
PCAF Green

Geomagnetic activity probabilities 12 jan-14 jan

A. Middle Latitudes
Active 50/40/35
Minor Storm 30/20/15
Major-Severe Storm 05/05/01

B. High Latitudes
Active 50/40/35
Minor Storm 30/20/15
Major-Severe Storm 05/05/01

HF propagation conditions were near-normal over the low and middle latitudes. High and polar latitudes were also near-normal until approximately 12:00 UTC when minor signal instabilities began to be noticed with the onset of enhanced geomagnetic and auroral activity. Conditions deteriorated rapidly thereafter. Barely usable propagation was observed between approximately 17:00 and 19:30 UTC, with some upper middle latitude regions also noticing degradation. Effects were most pronounced during the local night-sectors. Conditions then showed some improvements for the remainder of the day. Propagation is expected to be unstable over the higher latitudes during the next 24 to 48 hours. Fair to occasionally very poor propagation can be expected. Middle and low latitude regions should remain near-normal with

night-sector conditions occasionally dipping to fair levels,
particularly on circuits approaching the proximity of the
auroral ovals. Conditions should begin improving on 13 or 14
January.

------ ---- ---- ---- ---- -- ------ ------ ---

NO EVENTS OBSERVED.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

sure.

Yes, you will need to file a form 610 for a replacement license, but it's not necessary to go through a VEC to submit it. You can mail it to Gettysburg yourself. I think they might automatically give you a new expiration date (that is, your license would be good for 10 years from the issue date of the replacement ticket).

I think you are referring to the picture of WA1EKV, who lives a short distance from here. His LP with it's 60 foot boom looks positively SMALL, compared to the 4 element, full size 80 meter beam he used to have up. Both are pretty impressive sights!

Paul - I came into this discussion late, so if you found the $1.98 (or
equivalent) part from somewhere else, could you let me know how much and
where?

I will be putting my 1274 on line for HF packet forwarding in a few days
and didn't know about the clock chip. Guess I don't have one now.

Thanks!

Bid : $RACESBUL.308

TO: ALL ES, CD, AND PUBLIC SAFETY DIRECTORS VIA AMATEUR RADIO
INFO: ALL RACES OPERATORS IN CALIFORNIA
INFO: ALL AMATEUR RADIO OPERATORS
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6SIG@WA6NWE.CA)
2800 MEADOWVIEW RD., SACRAMENTO, CA 95832 916-262-1600
LANDLINE BBS OPEN TO ALL 916-262-1657
RACESBUL.308 RELEASE DATE: January 10, 1993
SUBJECT: TNG - Training for RACES people - Part 1/3
What kind of training could or should be given RACES
operators by disaster response (OES, CD, etc.) organizations? The
following are some worthwhile meeting and training topics
submitted by volunteers and paid staff in California, Nevada,
Colorado and Utah. Every effort to provide handouts should be
made. A three-ring binder format is successful.
These are not shown in any particular order of priority nor
does it reflect ALL the topics that could be covered. These are
simply the most common topics that should be covered for all
Amateur Radio operators assigned to a local government's RACES
unit.
1. Write or update the RACES Plan.
2. Agency policies, procedures, practices and philosophies.
3. Message form and message center (handling) procedures. Keep it
simple!
4. Names and titles of key local government leaders, department
heads, and division chiefs.
5. Incident Command System (ICS) and ICS communications.
6. Mission of the organization.
7. Inter-agency relationships.
8. Inter-government relationships.
(To be continued in the next Bulletin)

If you look at the actual power density numbers in proposal that was
posted, and do a bit of arithmetic, you will find that you need
a hefty power output (100's of watts) within 20 or 30 feet to exceed
the limits. If you are running a kW twenty feet from your neighbor's
bedroom, they have a right to get upset.

273. Re: Log Periodics and DXing

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-12 09:10:23 UTC
From: dstock@hpqmoca.sqf.hp.com
Message-ID: <CJIEtC.7qu@hpqmoea.sqf.hp.com>
Source record: 272419

The log-periodic is a specialist antenna for wideband, continuous frequency coverage. Their design is related to bandpass filter design, but in simplified terms, a passband is chosen, and then the number of elements per octave is chosen. The gain has ripples across the passband, rather as a Chebyshev filter has. Choosing the number of elements per octave sets the amplitude of the ripple. The return loss (another way of expressing impedance match, like VSWR) is a series of deep dips, having more elements per octave spaces these dips closer, and so the return loss is better beween the dips... in other words, the VSWR varies cyclically across the antennas bandwidth, and the number of elements/octave sets the peak VSWR.

Log periodics can be made with high gain, if the number of elements/octave is made large, but for a 14-30 MHz antenna, this would be huge... you would be wasting elements and their associated boomlength to cover frequencies between the amateur bands and the space between bands is far, far wider than the bands.

The log periodic has had its gain/size sacrificed to give continuous coverage.

I find it interesting that this is fast becoming a fashionable antenna. They are certainly big and very impressive, but for the same gain as amateur bands only beams, far more boomlength and far more elements are necessary. People with log periodics seem to think them wonderful, but measurement and comparison of full size HF antennae is a major undertaking, and the subjective assessment of antennae is impossible due to the far greater variability of band conditions.

I hope this helps a little

Cheers
David GM4ZNX

(For adding WARC bands to high gain HF antennae, the multi-element quad seems a good starting point, loops for added bands have been nested inside existing triband quads by several people, and the results have sounded encouraging.)

>|--

I've been using a J-pole for years now.. it's made of 1/4 inch Al, and
breaks down into 3 x 1/4 wavelength sections. When I go tramping (hiking)
into areas where rptr coverage is marginal, I just strap the thing to the
side of my pack (slip it inside my compression straps). Takes less than
a minute to take it off the side of the pack and assemble it, and it
weighs next to nothing. The antenna has survived fairly rough treatment,
and is still going strong. I've decided that the extra hassles involved
in carrying a beam (ie extra weight and bulk) are not justified; the
J-pole is also easily repairable should any damage occur.
What I am now looking for is a rugged dual band antenna design (no radials)
that I can break down and throw onto the pack. Any suggestions??? Some of the
hills around here reflect UHF signals into the valleys much better thhan 2m
ones, though generally, attenuation in the bush on 70cm seems to be a lot
greater than at 2m.

cheers,
Dave, ZL2BHE.

My recent experience with the DXCC desk has been similar, i.e., excellent! -- They've been turning a few-card-endorsement around in super fast time..so, in November I sent in a new band application involving 114 cards. Including the day of the mailing and the day of receipt, they received, processed and returned the 114 cards in 10 days flat! [The award, per se, arrived about 3 weeks later.]

My hat is off to the DXCC Desk...what a change, whew!

Dave, I have had good luck with XPCOM. It is written by a guy out west, KB7XP, I think. You can hook up two tncs to two different comm ports and it will put the text from each one in a separate window. It wants to see either a PK232 or MFJ1278, but I have used kantronics tncs with it too. If you have two pk232s or aea tnc's it will use them in host mode. It is shareware, try and buy. One of our local guys sent a letter to the author with, I think, a bug report, and got a very nice note back, so the author is very responsive. What I'd like to find is a packet program that uses host mode for the MFJ tnc's. I wish I could tell you where to find a copy of xpcom, but if no one else can tell you, I'm pretty sure I have one around here somewhere, all zipped up and ready to go.

David,

Try a rolled up J-pole. It's made of 300 Ohm Twin lead and tapped with a
50 Ohm coax with BNC connector on opposite end. It provides about 2.8dB
gain. You can buy the ant from MFJ for about $12 or build it yourself.
The dimensions are below:

```
-- for 146MHz center freq
|
|
|
|
this side |
56" |
| | <---------------------------------- trim here for best SWR.
| | 14" on this side
| |
coax====> - - 1-3/4" tap from bottom
| |
---
```

I've experimented with lots of these with good results (built about 30 or so
for myself, friends, and local HAM classes).

Good luck and 73,
Tom

>Al you are correct, I did not mention low power. IF you use less then 100mw and
>a antenna for less then 5' in length then I beleive that it is legal. I thought
>that a higher power was implied though.

You would think that amateur radio operators would know the rules better than
this. Part 15 of the FCC R&R's governs unlicensed transmitters.

Fellow hams...
PLEASE stop propagating these myths.

The Part 15 rules give the maximum permissible field strength at a specified
distance from the antenna. For transmissions in the FM broadcast band, the
numbers are 250 microvolts per meter measured at three meters. Note that
this is a near-field measurement. For a ground-plane antenna, the necessary
power to achieve this field strength is approximately 3 NANOWATTS. For a
dipole antenna, 6 NANOWATTS will be the maximum permitted power.

Many commercial wireless microphones and FM home-broadcaster kits far exceed
these power levels and are illegal to use by FCC rules.

>have chosen.

This sounds like the ravings of somoene who had a coordination denied, or who wants to start a repeater war and not have the FCC come explain the situation to him. You obviously have not been on the other side of the table.

> I suspect less than 1% of the so called coordinated
>repeaters in operation today have any sort of REAL engineering
>study including contour maps done on them. Most have been 'coordinated
>' by either first come first served ---- or Good Ole Boys Network
>methods.

First come first served is the only way that coordinators can operate and not get their collective butts sued off. Don't believe me? I've been there, again, and so have others. As for the kind of real engineering studies you advocate, do you know how much time and effort goes into producing a contour map? Multiply that by a thousand repeaters in Texas. It's prohibitive. We coordinate repeaters based on 85-mile seperation, and will waive that if the trustee of the existing system will agree in writing.

>This information is publicly available for EVERY commercial radio
> and televion station in the USA and there is absolutely no reason other
>than small minded POWERMONGERING politics that this isn't available
>for amateur repeaters.

How about time and money? Are you volunteering to run all those contour studies, or pay to have them done?

>I dare ANY so called coordinating group to prove me wrong by PUBLISHING
>there engineering studies for all their "coordinated" repeaters.

They don't exist to the degree you want, nor are they ever likely to in the amateur service.

>All we'll probably hear is eithe silence or a crescendo of flames
>about how their "integrity " has been insulted....but the engineering
>studies generally don't exist so we will never see them!

No flames about integrity here; just cold, hard reality. Then again, you sound like you've been hit by reality before, and didn't like it.

281. An online repeater database

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-12 16:42:12 UTC
From: yee@mipgsun.mipg.upenn.edu
Message-ID: <2h1994$oaq@netnews.upenn.edu>
Source record: 272425

OK guys, here is the beginnings of a project that I have been working on since about February 1993. It is my next etext and is an online repeater directory which currently contains over 1400 entries. There are entries for CT, DC, DE, HI, ID, KY, ME, NC, ND, NH, NJ, NY, PA, RI, SD, VT, WV, WY. I have started on UT (but have a volunteer for data to provide complete info) and have finished three states since the last time this thing was posted.

Assistance in other states would be appreciated. I would be interested in volunteer assistance in completing this database. Volunteers should be willing to take up an entire state. Partial state listings do me absolutely no good as I will have to go over everything by hand to see what is missing. If all those people who are interested in getting an online directory together would be willing to volunteer for one or two states each, then this directory will be completed in short order.

Is this project serious? Yes. As a gesture of good faith, I have not concentrated solely on regions of the country where I live and work for the states I have already completed. As you can readily tell, I have already personally completed 18 states and intend to continue working. Any effort that a volunteer might make is not likely to be wasted. Unfortunately, I do not have the time or the energy for all 50 states. I already have someone who is willing to provide data for Montana and Utah. If you guys are actually interested in an online directory, put up or shut up.

If there are file format revisions after 0.2, I will worry about the file format conversion but I don't expect that there will be any need as all or nearly all important fields have already been defined and (hopefully) plenty of room has been left for expansion of the field definitions.

At first, this directory will contain only 2 meter entries. After all 50 states have been completed, updates will then be accepted. If someone else is interested in tackling other bands, it would be most appreciated. The proposed file format should be flexible enough for all bands and all modes for which a repeater directory would be useful.

I make absolutely no claims as to the accuracy of ANYTHING!! There are undoubtedly numerous errors all over the place. Some are typographical errors on my part (the data has been typed in by hand). Other errors are due to outdated information. Little or no attempt has been made thus far to check the data at all as I consider it more important to finish the database itself. In general, corrections to

the database will not be applied until this is done.

==========

The file format (version 0.2) shall be as follows. Consider this file format to be in the alpha stage and subject to frequent and arbitrary revisions. Each entry will be delineated by being on a different line. Each field of a repeater entry shall be delineated by colons. The text within a field shall not contain a colon. The field definitions are as follows:

0 latitude (deg,min,sec)
Each component of the field shall be delineated by commas.
1 longitude (deg,min,sec)
Each component of the field shall be delineated by commas.
2 elevation (meters)
The metric system has been chosen for this field fo the eventuality that this database is expanded internationally. Unfortunately, in backward countries such as the US, the English system is still dominant.
3 height above average terrain (meters)
The metric system has been chosen for this field fo the eventuality that this database is expanded internationally. Unfortunately, in backward countries such as the US, the English system is still dominant.
4 spare location designation if grid squares are used for some repeaters while others have the above.
5-7 reserved for future use (e.g. ERP)
8 continent
9 country
10 major region designation (e.g. state, province)
Use standard abbreviations if possible (e.g. NY, CA).
11 minor region designation (e.g. county, nearest major city)
12 immediate location (e.g. town, city, mountain)
13 input frequency (MHz)
14 output frequency (MHz or standard offset: + or -)
The use of +,- may have to be deleted in the future if this repeater directory is extended to other countries that have differing standard offsets.
15 repeater call sign
16 misc. notes (for anything not covered in other fields)
17 sponsor (call sign or club name)
18 source of entry (call sign preferred)
If entry is copied from a published source and not personally verified, use the organization publishing the data (e.g. ARRL)
19 date entry last updated (YYYYMMDD)
Since published data may only have a year of publication, the date shall have a month and date of 0000 (e.g. 19940000).
20 PL access (Hertz)
If multiple for multiple inputs, delineate with commas.
If none, enter 0.0

21 mode (e.g. F3E, A1A)
22-27 reserved for future use (e.g. trustee)

Any subsequent fields are free for users to define for their own use.

Conway Yee, N2JWQ
yee@mipg.upenn.edu

282. WANTED: Info on Standard C5718DA

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-12 16:44:10 UTC
From: benjy@benjy.cc.vt.edu
Message-ID: <2h19cq$gjp@vtserf.cc.vt.edu>
Source record: 272426

Hi,

I'm interested in Standard's C5718DA dual-band mobile rig and
would like to hear from anyone who has experience with it.
I'm looking for a rig that I can mount under my car seat
and operate from the mic so that I don't have to mount a
control head on the dash.

Please e-mail if you have any knowledge of this rig.

Thanks, Benjy

Since a J-pole is an end-fed 1/2 wave vertical, how does it have
2.8 dB of gain? 2.8dB of gain in relation to what? A quarter-wave?
A dipole? An isotropic radiator?

Optimally, a J-pole will have 0 dB relative to a 1/2 wave dipole,
but the matching section contributes loss, so I'd normally expect
a J-pole to provide a little less than 0dB, say -.5dB relative
to a dipole. If so, this is something like 1.5dB over an isotropic
radiator...

True, but normally those "wireless microphones" aren't described as "ham or
modified ham set ups" (though there are people who have converted 49MHz
walkie-talkies to 6 meters...).

I just read what you are looking for, and based on your wish that it
hear spectacularly from 30MHz to well over 1,000MHz, and also function
as a gain transmitting antenna for 146MHz and 440MHz...all the while
not looking obtrusive and marring the natural lines of your pickup
truck...

I suspect you would find better answers in
alt.fountain.of.youth.I.found.it

You are asking for the near impossible, and just a guess, but you
probably don't want to spend more than, say $50..., right?

That is a more difficult quest than the Fountain of Youth or the Holy
Grail... it *IS* the Holy Grail of mobile antennas...

No wonder no one answered... there is no answer... wonder why I
tried...? ;^)

288. DIPOLES FED BY LADDER LINE - Q

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-12 19:07:16 UTC
From: MAYNARD@URIACC.URI.EDU
Message-ID: <199401121918.LAA17597@ucsd.edu>
Source record: 272333

Please excuse my laziness in not researching this myself...

I just bought an antenna tuner and want to put up a dipole fed
by 450 ohm ladder line, for use across 160-10 meters. The longest
one I have located commercially is one 135ft long with 100ft of
feed line, for 80-10 meters (much cheaper, incidently, than building
from scratch with current wire prices!). Anyone have an opinion
on my going to ~260 ft (yes, I do have room), especially regarding
performance on higher bands (40-10 meters).

Thanks for reading this, Brian WY2G

289. Mac owners....READ THIS!!

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-12 19:21:42 UTC
From: tofi@krksun.krk.fi
Message-ID: <1994Jan12.192142.12327@krk.fi>
Source record: 272335

OK, pals.

Here's a list of Ham related Mac software. The files are in a .HQX format,
so just thorw me some mail and I'll send you the files you want.

DX Map 1.1

The following is from a help field that can be accessed from within the stack.
This stack requires the version of Hypercard to be 2.0 or greater.

This stack enables amateur radio operators to find the location, bearing, and
other information for the 'DXCC' countries of the world. It also displays the
day and night portions of the globe dynamically.

MacDOVE

MacDOVE is a simple FORTRAN program for decoding or converting recorded DOVE
telemetry packets into engineering units on a Macintosh 512K, Plus, SE, SE/30,
or II-series computer. Note that MacDOVE does not decode packets directly
from a TNC but from a file of packets previously recorded. Both the
source code and the application are available from the address below.
The present version of MacDOVE does not use any of the special
window/menu/mouse features of the Mac
and so the source code should be compatible with other machines.

MorseTrainer US-1.0.1b20

MorseTrainer is a program for learning and training Morse code. This is the
first translated version of the program which originally was developed and
localized for Sweden. The program itself can be considered a final version
of v1.0.1 but the translation is probably not perfect, hence a beta-release
instead of final-release.

SunClock

PacketTracker

For the network manager and BBS operator, PacketTracker provides extensive
insight to the operation of the local network and the problems such as
excessive retries on a path.

SPARKS-II

Morse trainer type.

WORLDTIME.sea

1) It tells you what time it is in other cities, taking into account
Daylight Saving Time/Summer Time.
2) It automatically resets your computer's clock at the beginning and end
of Daylight Saving Time/Summer Time.
3) It allows you to change the location of your computer as it is stored
in your computer's memory and reset the clock appropriately.

MORSE CODE TUTOR

Morse Mania

This program was written as a practice program for people already
familiar with the International Morse Code. It allows the user to
practice copying Morse code at various speeds and at different audio
pitches.

MorseMaster

This program can read any TEXT file, but the interval of carriage
returns should be less than 256 characters to send correctly. You can
open large file, but normally the latter part is truncated
(If it is too large, an alert box appears).

Grid

This Macintosh program (MacBinary format) converts between coordinates
(longitude, latitude in degress, minutes, seconds) and the grid square
locator used by radio amateurs, and vice versa. The old European QTH
locator system is supported. The distance and heading between two points
on earth can be calculated. The program will automatically recognize the
coordinate system used: longitude/latitude, worldwide grid square locator
or European QTH locator.

If you are using a tuner, then 3 basic rules apply:

1) Make it as LONG as possible
2) Put it as HIGH as possible
3) Keep the feed line away from metal (6" or more)

If anyone tells you an antenna must be resonant to work well, punch them in
the head.

>
> ...stuff deleted...
>

I agree with Barry that the common microwave oven frequency of 2.45 GHz does not correspond to a resonance of the water molecule. I also agree that the lowest resonance for water is around 22 GHz.

However, that resonance is exhibited by _gaseous water_.

So far as I know, neither liquid water nor ice exhibit any RF rotational resonances, but I'm not certain.

By the way, the dielectric loss factor of pure, liquid water does show a peak at about 1 GHz at 0 Celsius, moving up to about 10 GHz at +20 Celsius. Sea water shows a rather constant loss factor over that frequency range (pretty much the same at 0 and +20 Celsius), increasing at lower frequencies and falling at higher frequencies. These are my recollections from data presented in an appendix to Volume 3 of _Microwave Remote Sensing_ by Ulaby et. al.

: Fellow hams...
: PLEASE stop propagating these myths.

: The Part 15 rules give the maximum permissible field strength at a specified
: distance from the antenna. For transmissions in the FM broadcast band, the
: numbers are 250 microvolts per meter measured at three meters.

: Many commercial wireless microphones and FM home-broadcaster kits far exceed
: these power levels and are illegal to use by FCC rules.

I haven't looked at the part 15 rules in years, but unless they have
changed, you are allowed to use EITHER the field strength limit OR the
power and antenna length limit.

The 260-foot antenna would work better on 160 meters. You could probably load up the 135-foot antenna on 160, but efficiency might be poor because of the low radiation resistance.

On the higher bands, the main difference with the 260-foot antenna would be the radiation pattern. On 80 meters, the pattern would be a cloverleaf (maximums at approx. 45-degree angle from the wire) instead of bi-directional perpendicular to the wire. On 40-10 meters, the antenna would tend to be more directional off the ends of the wire than with the 135-foot antenna.

> control head on the dash.

I bought one of these about 4 weeks ago and I LIKE IT!!! I've been getting excellent signal reports, and have heard others using the Standard on the air with excellent sound quality.

One of the main reasons I bought this model is the microphone setup. I do exactly what you're planning on, I put the radio under the seat (I will eventually install it in the trunk) and use the microphone controls which are full featured. The Display on the microphone is very easy to read, the labels are backlit (are actually translucent so light from within the microphone shines thru them), and using the features becomes very easy after a short period of acclimation. How often do you run into a radio where a control head is an option? :^)

I have yet to run across any Intermod problems. In fact one of the reasons I first looked at the Standard was from hearing that they were much less susceptible than most other brands (something to do with them using a different IF). The only Intermod I've heard since I bought this radio has come over the airwaves from someone else.

This model comes packet (9600 baud) ready, but I really can't say anything about that as I don't do packet yet. It has a wide range of scanning capability (100MHz-199.99MHz including AM capability, 250MHz-499.99MHz, and 800MHz-999.99MHz)

So far I, and another user, have only run into two issues that we consider problems. The biggest one is that, at present, when using crossband repeat mode the output won't include a PL tone. The other is that there seems to be no direct way to pull a frequency in memory into VFO mode (Scanners often do this with one or two keystrokes). You instead have to enter the freq. manually (no big deal). We have talked with Standard about these, and Standard is apparently going to have a fix for the PL problem sometime in February (for free of course :). I'm not sure about the Memory->VFO issue yet.

Overall, I'm extremely pleased with the radio. It ain't cheap but works real fine.

296. Learning Morse - which letters to start?

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-12 21:30:46 UTC
From: tjf@beta.lanl.gov
Message-ID: <tjf-120194143046@mamie.lanl.gov>
Source record: 272346

Will wonders never cease? My XYL asked if there was a class she could take to get her license just as one was announced on the local 2m net!

The class instructor said he was teaching only the written material for Codeless Tech license, so I will be the code coach for my wife. Although I've only had my license about a year, I actually learned the code in Junior High School (more than 20 years ago). I don't remember how you go FROM SCRATCH! Seems to me I learned A,N,R,S,E,I,H first, then W,U,M,O,C etc. Is there a preferred way or order to learn the letters from scratch? All I have in the house now are 15-20 WPM tapes and a couple of code programs for Mac for people who already know the code. How should I proceed? My oldest son is learning by sending "secret" messages to me with a homebrew CPO. I started him off with the letter groups I mentioned above, but I am not sure what is best.

Any comments, please post or email!

Thanks,
Tom

Has anyone managed to eliminate the residual clicks that are generated
along with the characters in the Sun version of this program (see
comment in beepSun.c)? They are quite noticable, especially at higher
speeds.

Also on my wishlist: a version of the program that would produce a
Sun .au file for use by other programs.

Brian, going to 260 feet may not help much at all at 160 unless you can also get the antenna about 1/2 wave *high*, and that's typically not the case. It would present an easier impedance to match than the 135 footer at 160, but then you'd have a harder impedance to match at 80 meters because you'll have two halfwaves being end fed and that's an extremely high impedance point. 40-10 patterns are going to be a bunch of minor lobes anyway.

For an all band flattop, it's best to *not* make the antenna a resonant length for any of the ham bands. The reason is that on bands where the legs are halfwaves, or multiples of a halfwave, the feed point impedance is going to be extremely high. If you choose a length that's non-resonant, the impedance at the feed point will be complex, but not extreme, on any ham band. That works better with most tuners.

The classic 80-10 flattop has a length of 105 feet. That's non-resonant and works well with open wire feeders and a tuner. Doubling that to 210 feet could be useful to increase capture area and make it more efficient at 160. Performance at 12 and 10 meters could be somewhat worse with the 210 footer than the 105 footer because of the extra minor lobes.

If you want clean pattern gain on 40, 30, 20, 15, 12, or 10 meters, you're going to have to use a resonant design with the legs broken by stubs at the appropriate lengths for a band so that you have a series of broadside halfwaves fed in phase. It won't be a good all band antenna anymore because stubs for one band will be in the wrong place for other bands. There are better wire antennas than this, such as one of the various curtain antennas.

>issued one, but I haven't seen it.)

See NIST Special Publication 432 (Revised 1990), inside cover
says "Supersedes NBS Spec. Publ. 432 dated September 1979.

Oh, I can't find a mention of TV color signal calibrating at all
there. See the 1979 version (NIST was NBS then), page 10 & 11
section 7 titled "Digital Frame Synchronizers and
TelevisionTechniques". <sic>

This section explains that a frame synchronizer replaces the
original accuracy of the network feed with the accuracy of the
local station reference. It also says that only a few stations
have them, but this will change if the cost of frame
synchronizers drops...

I'd guess a bit of RAM and some timing circuits cost a bit less
now than in 1979. So this implies that TV color carriers are
useless now as a frequency standard. Which probably explains why
this information was dropped from Pub 432.

You're right, the new Pub 432 should probably have made a point
of "retracting" this bit of information. Instead they just
dropped all mention of it.

PS: The old Pub 432 does mention that there may be a special case
where good color references may be available. The old pub
claims that ABC stations in Los Angeles and New York are
co-located with their network studios and use the network
cesium references. Anyone know if this is still true? Or
has their cesium reference outlived it's lifetime and not
been replaced?

Society.

QUESTION.....
Why has Dural been off air in such a state of emergency?

In this emergency that is affecting so many people in the
northern parts of Sydney, why has the WIA Council
(VK2 Division) kept Dural repeaters off air when there is such
a need for communications in this catastrophe ?

I find it incredible that the Council does not respond to this
emergency and put the repeaters back up as a public service
regardless of the reason for taking them off air.

Pat VK2JPA Broadcast Officer ANARTS

Due to the emergency situation in eastern New South Wales, I
am holding back the series on Guidelines for the preparation
of programs for transmission by Amateur Radio Teletype sent to
us by Frank VK2FJL. This will now commence next week - surely
the fires will be gone by then, and the amateurs back at their
sets ...

Spare a thought for any amateurs affected by this desperate
situation. If many are affected, is there some way we who are
safe can help get them back on air ? Thoughts to this end
would be appreciated. Contact Pat VK2JPA at VK2GJB while
VK2RWI is off air, or drop a fax to (02) 622 9604 during
working hours.

Syd, VK2SG, back on air

With the help of Bill, VK2EG, and Bruce, VK2RT, Syd's shack has been moved into his house to make up for his lack of mobility and Syd is back on air, except for CW. Be prepared to hear him on Pactor etc., maybe even a few contacts in contests, depending on his health at the time.

What Syd does need help with is the chain drive for his quad which is on top of a 65 foot free-standing tower.The chain has come off again so he is restricted to a north-east heading. Is there some energetic person out there with the time and expertise to assist ? Contact Syd on (02) 631 2576. Tell him you saw it in the broadcast.

Attention Volunteer Coastal Patrol operators

The Royal Blind Society of New South Wales, in conjunction with the Maritime Services, have produced a tape which consists of frequencies, times and weather forecasts together with ocean conditions, traffic, and many other services which have reference to shipping operations (including safety) that are normally broadcast by the Maritime Services (O.T.C.).

This tape has been produced to assist the blind or dyslectic operators that are assisting with the operations of the Volunteer Coastal Patrol services throughout Australia. The tape is a C60 twin track cassette and is available from the Royal Blind Society of New South Wales for a slight cost.

The tapes are now available, after some delay was overcome.

Please direct all enquiries to Jim Bates at the Royal Blind Society of New South Wales, phone (02) 334 3333, 4 Mitchell Street Enfield Sydney.

Seen in the RTTY Digital Journal and reprinted there from somewhere in a US communications network. Just a bit of light humour ...

To all visitors

WHAT YOU ARE ABOUT TO WITNESS IS AN AMATEUR RADIO STATION, LICENSED AS BY THE FEDERAL COMMUNICATIONS COMMISSION. BEFORE YOU ASK QUESTIONS, CONSIDER THE FOLLOWING -

1. The total cost of this equipment cannot be discussed here as it creates marital conflicts.

2. No, I cannot send a message to your brother in Hong Kong, I suggest you call Western Union.

3. This is strictly a hobby; I do not have the facilities or the time to fix TV sets, radios or Hi-Fi. I suggest you see a serviceman.

4. Yes, the antenna in the backyard is essential to the operation of the equipment.

5. The farthest station we have contacted has been in the Ubangiland.

6. The cards on the wall are called QSL cards. They are confirmation of contacts made with other stations.

7. Oh, no!! Never does this station equipment interfere with television reception.

Furthermore -
IF YOU ARE INVITED TO SPEAK INTO THE MICROPHONE, PLEASE OBSERVE THE FOLLOWING RULES -

1. Speak in a low and soothing tone.
2. Do not agree with me in any manner.
3. Say no bad words and tell no off-colour jokes.

DO NOT TOUCH ANYTHING, TURN ANY KNOBS, OR SIT ON THE EQUIPMENT. I HAVE LOST SEVERAL VISITORS BY ELECTROCUTION IN THE PAST FEW WEEKS.

IPS weekly report
---

31 December - 6 January 1994

Issue no.: 01

Date of issue: 7 January 1994

Date 30 01 02 03 04 05 06
10cm 141 148 146 133 129 137 132
A 16 21 19 13 06 05 (10 estimated)
T 116 51 46 55 73 80 86

Summary of activity

Solar activity was very low 1st and 3rd-4th January, low 31st December and 6th January, moderate on 5th, and high on 2nd with an M6 flare on that day.

The geomagnetic field at Learmonth (WA) was -

31st Quiet to unsettled with active periods 0600-1200 UT
1st Unsettled to active
2nd Quiet to active
3rd Quiet to unsettled, with brief active period 1500-1800 UT
4th Quiet to unsettled

5th Quiet
6th Quiet to unsettled

Ionospheric F2 critical frequencies at Sydney were near normal or enhanced by up to 50 per cent. Strong sporadic E was observed on 31st-4th and obscured the F layer at times each day.

Forecast for the next week (7 - 13 January)

Solar : Low.

Geomagnetic: Quiet with possible active periods 12-13 Jan.

Ionospheric: 10 - 20 per cent enhanced/near normal.

> Thanks for reading this, Brian WY2G

Brian, IMHO, the "dipole" fed with open wire line, or 450 ohm ladder line is the best, most versatile HF antenna for amateurs who want to operate all HF bands. Some combinations of antenna + feeder will yield easier matches with your tuner on most bands, but some compromise is generally necessary (see Bill Orr's Wire Antenna book). Generally, the more wire you have in the antenna (or radiating part), and the shorter the feedline part- the better. However, feedline lengths of even 100' should not cause significant loss.

If you choose the 260' model, you may care to have yourself a mini vee-beam (effective at about 10.1MHz and above) by placing the "legs" at about 90 degrees, and pointed at your favourite DX direction. Being unterminated, you get long and short path, depending on time of day, propagation etc. Approximate all-round operation is obtained at 1.8 thru 7MHz. My main HF antenna is one of these, the apex only 34' above ground, and the 135' legs each droop down to about 20'. The intersection of the legs points LP to Europe. This is the best DX antenna I have ever had. Even when conditions are poor, I can mix it with the big boys with their kW and rotatable beams etc.

With so much wire in the air- some sort of lighning protection is advisable. It is a good plan to ground the feedline with a "Frankenstein" style knife switch when the antenna is not in use. Also provide a spark-gap to ground for each side of the feedline as extra insurance should you forget to operate the switch.

ARL NNJ 94-002 -- NJ DEPE HEARING

HR ARRL NNJ SECTION BULLETIN 94-002
FROM ARRL NNJ SECTION MANAGER RICH MOSESON, NW2L
JANUARY 11, 1994

TO ALL RADIO AMATEURS / NNJ SECTION:

Amateur radio and the ARRL were well-represented at today's hearing by the New Jersey Department of Environmental Protection and Energy on its proposal to regulate RF transmitting sources in the state. DEPE officials had said that amateur radio would be exempted from the proposed registration and fee proposals for now, but did not include an exemption in the proposed regulation, and specifically invited comments on whether amateurs should be subject to them in the future. The public hearing in Trenton on January 11 was attended by approximately 50 people, some 25 percent of whom were hams. None of the approximately 20 speakers supported the proposed regulation.

ARRL General Counsel Chris Imlay, N3AKD, and ARRL Northern New Jersey Section Manager Rich Moseson, NW2L, spoke on behalf of the League and its more than 5,000 members in New Jersey. They were joined by state Army MARS Director Sanford Weinberger, AAA2NJ/N2BOT, and several other hams. Other ARRL leadership volunteers at the hearing included Southern New Jersey Section Traffic Manager Gene Bond, WB2UVB; Middlesex County District Emergency Coordinator Stan Olochwoszcz, N2AYJ; Morristown Emergency Coordinator Harvey Klein, WS2Q; New Jersey Phone Net Manager Dave Popkin, W2CC; Local Government Liaison Bill Sohl, K2UNK, and Hudson Division Assistant Director Ben Friedland, K2PBP.

Testimony was opened by Vivian Lopez, N2NZN, who challenged the state's authority to impose the regulations in the first place. Imlay and Moseson, representing the ARRL, argued that only the FCC had the power to license and regulate radio transmitters, and that applying the proposed regulations to hams would effectively preclude amateur

communications in New Jersey -- a violation of FCC rules. A specific exemption for hams was requested.

Written comments are due by January 20, although the comment period may be extended. A final decision on the proposal must be made by next December.

The Oregon State University Amateur Radio Club has a couple thousand vaccuum tubes. These tubes vary from military/commercial, new/used, and in original boxes. We hope to sell the tubes in a lot to form an annuity for the club to use for future developments. I have a list made up that lists the tubes, quantity, quality, and which box they are in. If you are interested, send me mail with the subject "osutubes" for an automatically generated reply containing the inventory. Your message will not be received by me unless it has a different subject.

We only want to sell as a lot.

Probably, but you can't beat the citizens band for having people (wierd as them are) that seem to know what the traffic conditions are. I guess they aren't too busy with fiddling with the autopatch, or scanning the cellular bands to know whats going on around them. Usually on a repeater, unless it was a regularly scheduled commuter group, nobody has a clue as to what's going on around them.

(The following disclaimer is for the cognitively impaired)

Isn't a DX-cluster a kind of MUD? (No offence intended, DX-ers!)

You might get some ideas by looking at the design of the DX-cluster software.

314. Signaling Device Wanted

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-13 11:07:33 UTC
From: ep208@garnet.berkeley.edu
Message-ID: <2h3a1l$i1t@agate.berkeley.edu>
Source record: 272363

My wife, daughter, and myself have carried pagers for over 10 years.
They are very useful for keeping in touch. Recently we have become
frustrated by the inability to find a public phone which is working,
not limited to outgoing calls, and not in use by a drug dealer. It seems
well less than half of the phones are available. Also, my wife drives about
45 minutes to and from her office and we would like to be in touch with
her during that time.

Since we have HAM licences, at HT for each person seems like a good
possibility. Some sort of digital squelch could be used. But they
both feel the HT is too big and heavy. I have pushed for that solution
for years. I have also suggested our own patch to the phone line and
our own phone-answering machine in the loop.

Pocket portable phones seem a possibility, but the cost nears $100 a month
for each if you consider connect charges, instrument cost, and
instrument protection from theft.

We have developed a series of codes which work fine for us. 1 means
"Everything is fine, I am where I should be, and on schedule."
1514 means "change the time to 15:14."

What they say they want is a device that can receive a few numbers
like the pagers, and one that can send a few like an HT. The notion
of some sort of digital attachment for a small HT comes to mind.
(My interpretation is that they prefer asynchronous (read and send
at different times) rather than synchronous communication like a telephone
which they feel is intrusive. With the pagers you can get a message and
make a decision about when to respond.)

Does anyone have any suggestions?

> feed line

W2FMI's article in the Nov 93 issue of CQ postulated that an 80 metre dipole fed with a quarter wave feed line (at 80 metres) would be the "worst case" scenario for a multi-band antenna.

He goes on in the article to say that that a 102 foot dipole fed with 31 feet on ladder line would not present as high a voltage to the balun than the previous example.

He then suggests that if one were to enlarge the second antenna to 160 foot flat top and 90 feet of ladder line, this would have yet better efficiency on 160 metres and still present manageable (sp?) impedances to the balun on 80 and 40 metres and above. I built the balun he suggested in the articlebut have yet to try it; with a new baby in the house, spare time is a precious commodity indeed!

>

Don't forget that, to see the bidirectional pattern of a half-wave antenna, or the cloverleaf pattern of a pair of half-wave antennas fed at the center, you've got to be a _significant_ fraction of a wavelength above the ground. We're talking close to a half wavelength here, and that's about 125 feet on 80 meters, and about 250 feet on 160 meters. When I model antennas at realistic heights above real ground on AO-5 (less than a quarter wavelength on 80 and 160 meters), the radiation pattern looks like an _egg_ sitting on its broader end, with the narrower end pointing straight up. In the horizontal plane it's _circular_, not directional at all. (The classic cloud-burner.)

The real world doesn't look like all those pretty pictures in the textbooks.

>> feed line

One extra question: how to feed such an antenna? If through an unbalanced tuner, shack will be RF hot. If also through a balun, the balun may have excessive losses and even generate harmonic. In my case, I tried to feed undersized dipole on 80 through a 1 KW air balun. The balun gets warm and the performance at 100W out is similar to .5W out with a regular dipol. I think that at SWR 10 and above, which would be normal for a ladder-fed dipole, multi-KW balun is needed to handle just 100W. The best option would be a symetric tuner, which is clumsy to build. Any comments?

>especially regarding performance on higher bands (40-10 meters).
>Brian WY2G

Brian, just one thing to add to the earlier responses. An antenna of
this sort has very little broadside radiation when the length is more
than one wavelength. My North/105' CF has a half-wave resonant frequency
of
around 4.5 MHz. On 17m, the lobes are at N55E,N55W,

I have hiked several times with my Cushcraft 4 element 2 meter beam. If you need the extra gain from a beam, it works great and is not overly bulky to carry if you pack it into a tube or keep it in the original box. I use wingnuts to speed the assembly process and have a portable tripod to mount the thing. It's sort of home-brewed out of a similar design I saw in the ARRL handbook. Anyway, like someone else said here, the AEA Hotrod is a great little telescopic antenna that outperforms a duck several times over.

>Anyone have an opinion on my going to ~260 ft, especially regarding
>performance on higher bands (40-10 meters). Brian WY2G

Brian, one thing to remember about this kind of antenna is that above around one wavelength, there is almost no broadside radiation. A North/South 105' CF has lobes at N55E, N55W, S55E, and S55W on 17m. When I put it up I aimed it broadside at Europe and heard nothing from Europe. After using ELNEC to view the four lobes, I rotated it 35 degrees and Europe came in like gangbusters.

325. Unix ham radio control program

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-13 18:39:16 UTC
From: cmoore@mothra.rose.hp.com
Message-ID: <2h44gk$f2n@hpchase.rose.hp.com>
Source record: 272377
Cross-posted to: rec.radio.amateur.misc,comp.os.linux.misc

As an offshoot of my project of writing an X11 logging program, I've decided I'd like to tackle writing a generic radio control program for Unix-like systems. My idea is something like this:
- A server process could be configured with information about what kind(s) of radio(s) you have, what serial ports to use, etc.
- The server would accept connections from other processes that want to interface with the radio.
- The server would communicate with the processes using some kind of generic radio control protocol.

This way other programs can talk to a radio without having to know anything about the details of communicating with it. They just talk to the server in a generic language and the server handles the radio interactions. This brings up the a few questions, and I'd like to solicit input and opinions from the net before I dig into this:
- What kind of functions need to be defined in the generic language? A few things that come to mind are things like 'get frequency', 'set frequency', 'get mode', 'set mode'. What other things might a program want a radio to do (assuming of course that the radio supports it.)
- Are there other things besides radios that might be controlled? Antenna rotators? Antenna switches?
- At some point I'll need details for the various known controllable things, like the command language for Icom, Yaesu, Kenwood, etc. Maybe people on the net can help provide these things for me.

After getting lots of response to my earlier posting about the X11 logging program I'm beginning to think there are lots of people running unix-like systems (mostly Linux) in their ham shacks. I'm hoping that I can come up with something that will serve the needs of a variety of interface requirements so that people can start linking up their unix boxes with their radios.

COUNTDOWN TO PETER 1ST. Hot off the Internet comes the first in a probable series of Peter 1st updates.

At dawn on January 12 the first group of operators left from Minnesota and Belgium on the first leg of the trip to Peter 1st. >From London they will fly to Ascension Island and then to the Falklands.

Their brief stay at Port Stanley will allow them to operate as VP8BZL on 160, 80, 40 and perhaps 20 meters with CW, SSB and RTTY. Plans are to install satellite and EME systems at the QTH of Mario, VP8ALJ.

The entire team plans a February 1 landing on Peter 1st. This operation will be 160 through 10 meters, satellite and EME.

THAILAND. Fred, K3ZO, is in Thailand until February 15. He hopes to be active as HS0ZAR from club station HS0AC. Listen for his 40 meter CW between 7015 and 7030 kHz during morning and evening gray line openings.

Reiner, DL2VK, is active as HS0/DL2VK until January 31. He favors CW but operates other modes including PacTOR. HS0C was worked from New England on 3505 kHz between 2130 and 2145z.

BANGLADESH. Manju, S21AM, was worked 20 meter longpath around 1240z. Manju is a newly licensed Bangladesh national. QSL via PO Box 4000, Dhaka 1000, Bangladesh.

WESTERN MALAYSIA. Neville, 9M2/G3NUG, will be active from three islands off the coast of Western Malaysia during January and February. His schedule is as follows. Pangkor, AS 072, from January 14 to 21; Langkawi, AS 058, from January 22 to 28; and Penang, AS 016, from January 29 to February 10. Listen for him around 14260 and 18140 kHz. QSL via CBA.

SAINT PETER AND SAINT PAUL'S ROCKS. The DXpedition by four Brazilian operators has been delayed until January 20 and will only be for two weeks. The group plans to have two stations going 24 hours a day, and operate 160 through 6 meters with CW, SSB, RTTY and packet. QSL SSB/RTTY/6M contacts via PS7KM. QSL CW contacts via PT7WA.

MONTSERRAT. Stu, K8SJ, will be on as VP2MFA from January 14 through 27. Here is his operating schedule. 1835 kHz at 0400z. 3502 to 3512 kHz from 0300 to 0600z. 7002 to 7012 khz between 0200 and 0300, and 1100 to 1200z. 14002 to 14027 kHz from 1900 to 2100z. 18077, 21025 or 28025 kHz between 1600 and 1700z. QSL via K8SJ 1994 CBA.

REGULAR CATCHES. The following resident amateurs are quite active on the air and are relatively easy catches.

Algeria, 7X4AN, 40 meter CW from 2230 to 2330z, and 3505 kHz at 2100z. Ascension Island, ZD8M, 7001 kHz at 0000z. Botswana, A22MN, 7004 kHz between 2200 and 2400z. Gambia, C53HG, 7013 kHz between 2300 and 0100z. Kuwait, 9K2MU, 3795 kHz at 2200z and 14017 kHz at 1600z. Mayotte, FH5CB, 21290 kHz at 1400z. Qatar, A71CW, 3507 kHz between 2130 and 0030z. Reunion Island, FR5BT, 15 meter CW at 1445z. Rwanda, 9X5HG, 20 meter CW at 1900 and 2300z. 9X5DX, 21024 kHz at 1300z. South Shetlands, 4K1F, 80 meter CW from 0200 to 0500z, and 7002 kHz at 0545z. Sri Lanka, 4S7NB on 14180 kHz and 4S7EA on 14192 kHz, both at 0130z.

W1AW RUNS QRP? Listen for members of the QRP club of New England, QRP NE, operating W1AW between 1800 and 2100z, Sunday, January 16.

THIS WEEKEND ON THE RADIO. The Winter NWQRP Sprint, sponsored by the North West QRP Club, is a CW only event on 3560, 7035 and 14060 kHz. The sprint is from 0100 to 0400z January 15.

The HA DX Contest, sponsored by the Hungarian Radioamateur Society, is from 0000z January 14 until 2400z January 16. This is a CW contest on 80, 40, 20, 15 and 10 meters. Non HA stations send signal report and serial number.

Meet the Novices and Technicians Day, sponsored by the YLRL, is from 1500z January 15 until 0500z January 16. OMs relax, this is a YL only affair in the Novice/Technician HF subbands.

The phone portion of the North American QSO Party, sponsored by the National Contest Journal, runs from 1800z January 15 to 0600z January 16. The exchange is your name and QTH.

Hunting Lions in the Air Contest, sponsored by the Lions Club International, runs from 0900z January 15 until 2100z January 16.

For more information on these events, see page 129 of December QST.

!!END-DATA!!

NOTE: The Effective Sunspot Number for 16 JAN 94 was 48.0.
The Full Kp Indices for 16 JAN 94 are: 2+ 3+ 4- 3+ 3+ 3- 3o 2-

SYNOPSIS OF ACTIVITY

Solar activity was high. Region 7654 (N08E55) produced
two impressive flares last night. The first was an M6/1N which
peaked at 16/2325Z. Optical reports indicated a Y-shaped
ribbon characteristic with the flare. Radio emission ran from
245Mhz to 15400Mhz to include a 190 sfu tenflare and 2.2E+05
start-to-peak integrated flux from 8800Mhz. A Type II sweep
with an estimated shock velocity of 400 km/sec was also
reported. The second flare was a C9/1N with weak radio
emission in the upper wavelengths. This flare peaked at
17/0919Z. Weaker C-class flaring has occurred since the C9.
Region 7654 has shown some growth in past 24 hours while

maintaining a relatively complex inversion line. The other spotted Region 7652 (N04E42) has been stable.

Solar activity forecast: solar activity is forecast to be low to moderate. Region 7654 should continue to produce C-class and some M-class activity for the foreseeable future.

STD: Big Bear reported a strong delta configuration within Region 7654, and bright plage particularly along the magnetic inversion line between the opposite polarities in the delta. This region appears to have potential for additional major flare activity and will be monitored closely.

The geomagnetic field has been at quiet to active levels in the middle latitudes for the past 24 hours. High latitudes have been at mostly active levels with some minor storming.

Geophysical activity forecast: the geomagnetic field is expected to be mostly unsettled for the next three days.

Event probabilities 18 jan-20 jan

Class M 60/60/60
Class X 05/05/05
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 18 jan-20 jan

A. Middle Latitudes
Active 30/25/20
Minor Storm 10/05/01
Major-Severe Storm 01/01/01

B. High Latitudes
Active 30/30/20
Minor Storm 10/05/05
Major-Severe Storm 01/01/01

HF propagation conditions remained unchanged since yesterday. All regions observed generally near-normal propagation, except for high and polar latitude night-sector paths were effects from periods of enhanced geomagnetic and auroral activity produced poor to occasionally very poor propagation. Similar conditions are expected over the next 72 hours. There is also a moderate risk for SWF activity over daylit paths.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max, and end times are defined as: B = Before, U = Uncertain, A = After. All times associated with x-ray flares (ex. flares which produce associated x-ray bursts) refer to the begin, max, and end times of the x-rays. Flares which are not associated with x-ray signatures use the optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

>
That is not product engineering! What the consumers did was to voice their
complaints about quality and ergonomics to the manufacturer. Because the
manufacturer responded to the suggestions in a positive manner and took the
corective measures the product was improved. However, it was not the public
that did the redesign it was the company.

SB QST ARL ARLB004
ARLB004 Licensing plan opposed

The ARRL has filed comments opposing an FCC proposal to grant immediate on-the-air privileges to amateur examinees before a license is issued by the Commission, preferring the early implementation of electronic filing as a better way to address the problem of excessive delays.

The League said it stood by its comments already made, on a petition for rule making that resulted in the FCC's proposal, in PR Docket 93-267. The ARRL told the FCC that its Notice of Proposed Rule Making, issued November 4, did not seem to consider the League's comments made last summer.

At that time, the ARRL said in response to a petition by the Western Carolina Amateur Radio Society-VEC that such a system was both unlawful and a would be detrimental to enforcement. The League said that the FCC had, as recently as 1987, denied such a concept and that the absence of an up-to-date database of such temporary call signs would make both self-regulation by amateurs themselves and rules enforcement by the Commission more difficult.

The League now has added that suggestions in the NPRM that precedents for such a plan exist in other services are incorrect; has reiterated its opinion that such a plan is inconsistent with the international radio regulations; and has emphasized that electronic filing of applications with the FCC would accomplish the same goal, of reducing the wait to get on the air, while maintaining total FCC oversight of licensing.

The reply comment date for this proposal is February 10, 1994.

CAC studies rovers

The ARRL Contest Advisory Committee (CAC) is studying the scoring for rovers in VHF contests. In particular they are looking at the impact of rover scoring on club competition in the January VHF Sweepstakes. The committee invites input on the following proposal:

''Rovers are not eligible for Club Aggregate Competition. Rovers may not engage in the practice of Grid Circling, which is defined as the premeditated (not coincidental) act of two or more Rover stations roving to the same locations at the same times and working each other, regardless of whether or not they work anyone else. This specifically includes family members traveling in the same or different vehicles.''

The following may also be included in the proposal:

''Rovers who are suspected of Grid Circling will be given a chance to demonstrate they were not before their logs are disqualified.''

Comments may be sent to: ARRL - CAC, 225 Main Street, Newington, CT 06111. Email comments may be directed to Internet Address: cacarrl.org

ARLB007 Earthquake 1

Amateur Radio Emergency Service (ARES) and Radio Amateur Civil
Emergency Service (RACES) operators are currently establishing
emergency communication in the aftermath of this morning's
earthquake in the San Fernando Valley. Operators are assisting
police, fire and other local emergency management officials with
local VHF communications.

Amateurs are advised that operators in the affected areas must give
priority to meeting immediate emergency communications demands.
Amateurs must not transmit on emergency net frequencies, except when
directed to do so by net control stations. When the situation has
been fully assessed and order restored, operators may be able to
provide health and welfare message services out of the affected
areas. Priority will be given to outgoing messages since most
amateurs in the affected areas will be unable to deliver incoming
messages until phone service is restored and roads repaired. Welfare
inquiry traffic should not be accepted from the public until
authorities in the affected areas indicate they are able to process
such inquiries.

>From Tad Cook, KT7H
Seattle, WA January 14, 1994
To all radio amateurs

SB PROP ARL ARLP002
ARLP002 Propagation de KT7H

Solar activity was down a bit last week after the significant rise in flux the week before. Average flux was down over 24 points and finally dropped below 100 on January 12. A and K indices dropped also, which signified quiet geomagnetic conditions and good propagation on 80 and 160 meters. The A index was single digits on most days and even reached zero on January 9 and 10.

By the time this bulletin was written geomagnetic conditions were active again, but are expected to quiet down, and then become active once more around January 25. Solar flux is also expected to rise again, peaking near 130 around January 26, and then dipping below 100 again after February 5.

Sunspot Numbers from January 6 through 12 were 144, 135, 119, 98, 74, 56 and 66, with a mean of 98.9. 10.7 cm flux was 132.1, 126.3, 122.9, 117, 110.1, 101.1 and 97.8, with a mean of 115.3

The path projection for this week is from Tulsa, Oklahoma to West Malaysia.

80 and 75 meters should be open from 1130 to 1400z, peaking around 1230 to 1300. 40 meters looks good from 1100 to 1400, and 30 meters from 1400 to 1530 and again around 2330. 20 meters should be open from 1530 to 2000, with the best conditions early in the opening, and again around 2300 to 0000. 17 meters looks good from 1630 to 1830, and 15 meters around 1730. On some days 12 meters may be open around 1700 to 1830, and there is a slight chance of an opening on 10 meters around 1800 to 1830. Tulsa's sunset is the same time as West Malaysia's sunrise at this time of year, and there is a chance of openings around 2330 on 15 through 30 meters. The odds are better on the low end of that range of frequencies.

346. Ham call CDROMS & SunOS/Solaris

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-18 19:25:12 UTC
From: ken@boxhill.com
Message-ID: <2hhd2o$o9n@boxhill.com>
Source record: 272296

I am considering purchasing one of the popular ham-related
CDROMs on the market such as Buckmaster or QRZ!.

How useful are these to the non-Intel/DOS/Microsoft
population out there who use Sun SPARC SunOS/Solaris?

I wish to use them for their callsign databases.

Can I mount these CDROMs from SunOS/Solaris? (ISO9660?)
Is the callsign database contained therein usable without
any of the x86 .EXEcutables that may be there?
Is the callsign database in a reasonably massageable format
that a reasonable C program could grok?
Which of the CDROMs out there would be most appropriate?
(Buckmaster & QRZ! are the only two that come to mind)

Thanks for any help.
Appreciate a cc: ken@boxhill.com to posted replies.

Source record: 272280

Leland Van Koten (LEEVANKOTEN@delphi.com) wrote:
:
: Maybe the problem is that the news media ignore the fact that
: "statistical significance" is generally defined as an observation (in this
: case, the number of cancers) that is sufficiently different from the expected
: level that there is only a 5% chance of it being strictly coincidental.
:
: Of course, that means that there IS a 5% chance that a result that is only
: marginally statisically significant will be due to chance. If you look at
: every possible cause of death in ANY group, you will probably see
: "statistically significant" excesses in one or more causes of death, purely
: by chance. It's only when you tend to see the same thing in multiple studies,
: have eliminated confounding variables, and have some plausible biological
: explanation for the observation, that it makes sense to talk about
: causation. Unfortunately, of course, those concepts don't make for great
: sound bites on the evening news.

Right on. A good example is the famous Milham study of ham radio operators.
Dr. Milham looked at something like 25-30 causes of death and found a
statistically significant increased death rate in one, as I recall.
I did a Monte Carlo analysis, using his death rate data, and assuming
a population with average death rates from each cause, and found that
you can expect one or two "statistically significant" increased death
rates, purely by chance.

Not to mention errors of interpretation and systematic experimental
error. For example, even if the reported amateurs' increased death rate
for one type of cancer turns out not to be a statistical artifact, it
could easily be due to other factors than exposure to RF fields.
(For example, exposure to solder flux fumes, chemical degreasers, and
other chemicals used by workers in the electronic field.)

350. Re: Dipole Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-18 20:33:54 UTC
From: alanb@sr.hp.com
Message-ID: <CJuEGJ.8oK@srgenprp.sr.hp.com>
Source record: 272282

Cecil Moore (kg7bk@indirect.com) wrote:
: Alan Bloom (alanb@sr.hp.com) wrote:
: : However, after you run through a few feet of twinlead/ladder line,
: : the impedance will no longer be so high anyway, so I don't think
: : it's much of a consideration. AL N1AL

: Al, if the impedence were 50 ohms at the antenna fed with 450 ohm
: ladder-line, the impedence would go straight up to a maximum of 4000
: ohms a quarter-wavelength down the transmission line from the antenna.
: I think you know better than what you said above.

No, I meant what I said. The questioner was talking about a 260-foot
center-fed antenna on 80 meters, which has a very high feedpoint impedance.
The longer the feedline (up to a quarter wave), the lower the impedance
at the other end.

However you bring up a good point. What matters is not the magnitude of
the feedpoint impedance, but the SWR. For example, with 450 ohm feedline,
a feedpoint impedance of 4500 ohms results in a 10:1 SWR. But if your
transmission line is long enough (over 1/2 wave), ANY impedance that
gives 10:1 SWR will result in a 4500 ohm impedance somewhere along the
feedline. For example, if the antenna is 45 ohms, you will get 4500 ohms
1/4 wavelength from the feedpoint.

If your antenna tuner "likes" low impedances (less than the feedline
impedance), then you do well to choose an antenna length and feedline
length that result in a low impedance AT THE TRANSMITTER end of the
feedline. That may require either a high or low impedance at the antenna.

Antenna tuners like the Johnson Matchbox, however, like high impedances.
A good antenna for a Matchbox is a dipole that is 1/2-wave long at the
lowest band in use, with 1/4-wave balanced feedline. For example, a
135-foot center-fed dipole fed with 60 feet of ladder line. This presents
a high feedpoint impedance on 80, 40, 20, 15 and 10 meters.

Thanks to all the helpers
==========
ANARTS says thanks to all the helpers who came to fight the
fires and to man the communications where needed. Had it not
been for all the assistance from other states, we would have
had a much harder time of it. When the usual communications
could not cope, about 140 WICEN members and other amateur
radio operators stepped in and held them together, often
risking their lives as the fires raced through at a rate
beyond expectation. They were even coordinating helicopter
operations at some places, I hear.

Our heartfelt thanks to you all.

Guidelines for the preparation of programs for transmission by
---------- Amateur Radio Teletype : By
FRANK VK2FJL.

Due to the diversity of RTTY equipment in common use
among Radio Amateurs, it is desirable that a few simple
guidelines be observed in order to ensure that transmitted
data is received as it is intended by the variety of
receiving equipment in use.

For instance - it is known that at least four
different keyboard layouts using different keys for the upper
case or upshift characters are in use by Amateur RTTY

stations. Certain characters are therefore incompatible and their use should be avoided. Indeed characters used on some machines are not used at all on others. Some examples are the exclamation mark, the commercial at, the ampersand, semi-colon and quotes.

Also, some RTTY'ers use `hard copy' teleprinter machines of various types, the most common being teletype (both CCITT and USA keyboard versions) Siemens, Creed and Olivetti. Others use `Glass' or computers which run a variety of RTTY programs, the main difference here being that computers reset almost instantly to the beginning of a new line, whilst the mechanical machines require longer time (usually 2-3 characters) for the carriage to fly back to the other end, recover, and prepare to `do it again'. These machines require a separate (CR) and (LF) to be received at the end of each line, whereas the computer only needs the (CR). It does not see the (LF) and automatically inserts one for itself everytime it sees a (CR). Line lengths also vary for different equipment : e.g 24, 32, 64, 69, 72, 76, and 80 or even more characters per line.

These mechanical differences, as well as the need for uniformity of layout, e.g. in broadcast production, necessitate the publication of a standard or protocol for the preparation of RTTY material.

Uniformity will also result in the perpetuation of a higher standard of transmitted RTTY, of which the individual amateur can be justly proud.

This `punch tape protocol' is recommended for use by all who prepare RTTY pictures, stories, programs, text or broadcast items for re-transmission, or for those who just enjoy having a higher standard associated with their callsign.

(1) END-OF-LINE PROTOCOL.

At the end of each line type (CR) and (LF).
Always type (CR) before (LF) - never the other way around.
For multiple line feeds type (CR)(LF)(CR)(LF)(CR)(LF), etc.
following the last (LF) add (LTRS) or (FIGS) as applicable.
For single line feed two (FIGS) or (LTRS) are recommended,
this ensures adequate non-printing characters following the
first (CR) for mechanical machines.

IPS weekly report
---
7 January - 13 January 1994

Issue no.: 02

Date of issue: 14 January 1994

Date 07 08 09 10 11 12 13
10cm 126 123 117 110 101 98 95
A 05 05 02 03 16 20 (20 estimated)
T 68 89 53 77 72 30 59

Summary of activity

Solar activity was very low 8th, and 10th - 13th January, low on 9th, and moderate on 7th. There was an M1 flare on 7th.

The geomagnetic field at Learmonth (WA) was quiet 7th - 10th, active on 11th, unsettled to active on 12th, and mostly quiet on 13th January apart from active to minor storm levels 1200 - 1800 UT.

Ionospheric F2 critical frequencies at Sydney were mostly enhanced 10 to 40 per cent except for a short 15 per cent depressed period on 11th, and near normal on 12th and most of 13th.
Forecast for the next week (14 - 20 January)

Solar : Low to moderate.

Geomagnetic: Quiet to unsettled.

Ionospheric: Mostly 10 - 20 per cent above monthly predicted values.

VK2SG RTTY DX NOTES FOR WEEKENDING JAN. 7, 1994 (BID RTDX0107)

A Happy New Year to you all, and may the good DXcome to your shack with a 599 signal. May all the good wishes that you have sent to your friends be returned to you manyfold. We all hope for a Peaceful and Happy Year. Surely this week has been a good start for 1994.

Our thanks this week go to: ZS5S, W2JGR WB2CJL, BV5AF, SP5AA, I5ICY, OH2BBF, DJ3IW and the Central Eu Dx-Cluster node DB0SPC, and NJ0M node of the Twin Cities Dx Packet Cluster.

NOTES OF INTEREST:
Regarding the RTTY Roundup contest Eric, OH2BBF/OH0BBF fired a big way 1800z sharp on Jan. 1st. After an hour and two QSOs switched to CW. He realized that was something wrong with the contest. The OH league magazine says "first weekend in Jan", CQ Magazine contest calendar says 1-2 Jan. 1994...He is sorry could not make another trip for the contest and informs that he is looking forward to be there again in the major RTTY contest. (what a pity).

PRATAS IS. The first trip into this Island now is over. BV9P has been active only on Jan. 5th from 0300z to 0700z on 14, 18, and 21 Mhz CW and SSB. Operators were BV2AP, BV4AS, BV4OB, BV5AF, OH2BH. Bolon, BV5AF President of CTARL informs that the 2nd BV9P DXped team will be available on air during March 1994. (we all wish for a longer stay and RTTY as well).

Send your bandpass and notes for next week to Bob, WB2CJL at W5KSI.#NOLA.LA.USA.NA or ZS5S.ZAF.AF.

GL de (DX2) Luciano, I5FLN AT ZS5S.ZAF.AF

Society information

The Society may be contacted at : PO Box 860, Crows Nest 2065 Australia, for such matters as membership and general enquiries. Enquiries can also be made by packet to the President (Col) VK2CTD, or the Secretary (Pat) VK2JPA @ VK2RWI

News items may be sent to Broadcast Officer PO Box 60 Blacktown 2148 Australia, or by packet to VK2JPA @ VK2RWI.

The Internet address for the Broadcast Officer is :

patl@extro.edu.su.oz.au [???]

The Society welcomes news items on any digital subjects from anywhere in the broadcast coverage area. We know we reach New Zealand and many South Pacific islands, we are looking forward to news from your areas to let other amateurs know what you are doing in the hobby. Hope to hear from you.

73s de Pat VK2JPA Broadcast Officer

That concludes ANARTS NEWS792 16/01/94.

Inserted by VK2BQS Jim, Vice-President ANARTS.

MEMBERSHIP RECRUITMENT & RETENTION CAMPAIGN

HOW WOULD YOU LIKE TO WIN A BRAND NEW RIG?

Members who renew, or non-members who join up between the 1st of December 1993 and the 28th of February 1994 will be eligible to win a new rig from Kenwood.

First prize will be a TM-241A 2m, 50 watt mobile rig, while second prize will be one of the very new TH-28A 2m, 5 watt handheld rigs. Total value of the prizes is over $1400.

There are no special forms to fill in or convoluted quizzes to answer - all you have to do is either join, if you're a non-member, or renew if you're a member. If your renewal does not fall within this period, no matter - you can renew early! If you do renew early, please do it through our Administrative Secretary, Margaret Morris, NOT through the Federal Office in Victoria.

Both prizes will be awarded by way of a draw and presented to the winners at the earliest opportunity this year after the close of the promotion.

Thanks go to Kenwood Electronics Australia who have generously sponsored the promotion by donating the prizes.

So, if your membership renewal falls due between 1st December this year and 28th February next year, or if you're considering joining - DO IT - you could be one of two lucky winners.

All grades of membership are eligible. Members currently on a three-year term will be included in the draw, as will life members.

THE DIVISION'S DURAL STATION CLOSED

Two recent events have brought about the closure of the Division's Dural station.

On Friday, December 31st, the Division was served with a letter from Solicitors Marshall Marks Kennedy, acting for Ms Val Bergman.

The letter alleged that she was seriously affronted by two packet radio bulletins which named her, transmitted to the Division's Bulletin Board VK2RWI on the 28th of December under the callsign of David Horsfall VK2KFU.

The solicitor's letter also alleged that these two bulletins were part of a series and that she believed she was being harassed by Mr Horsfall.

We must point out at this stage that Val Bergman is married to the Divisional Secretary, Roger Harrison.

In addition, the solicitor said that the bulletins were defamatory of her and pointed out that, under the Radiocommunications Act, the Division's station licence was subject to a condition that th station could not be operated, or permitted to be operated, in such a manner.

The Division was given until 5.00 pm on Friday the 7th of January to undertake to prevent such transmissions via the VK2RWI BBS in the future, or else the Division may receive an injunction to stop its operation. In addition, an action seeking damages for defamation was threatened.

This action is very serious indeed, not only for the Division, but consequently for all packet radio BBS operators, users of packet radio and the entire amateur radio service.

The point is that the Division, and any packet BBS operator, is a "knowing publisher" of whatever is posted to the packet BBS. Anyone who may be knowingly involved in the publication of defamatory material can be enjoined in a defamation action. And juries in recent defamation cases in NSW have awarded astonishingly high sums in damages.

This resulted in a decision to take the VK2RWI packet BBS off-air for the time being. Vice-President John Robinson VK2XY handled this legal business for the Division as Secretary Roger Harrison declined owing to his relationship with Val Bergman.

As if that weren't serious enough for the Division, on Sunday morning the 2nd of January, there was a broadcast made from Dural, which was purported to be an "official" broadcast. The text of that broadcast was also transmitted as a series of bulletins to the packet radio network under the callsign of VK2WI. These voice and packet broadcasts were unauthorised and contain material which is untrue.

In view of these serious events, and following considerable discussion among the President, Vice-President, Secretary, and two other Councillors, being a majority of the Council including the executive, the Institute's packet radio bulletin board system VK2RWI, was taken off the air on Sunday 2nd January 1994 and the equipment dismantled and removed from the Institute's property at 63 Quarry Rd, Dural.

In addition, the other transmitting equipment at Dural has been secured against unauthorised use and the building secured against unauthorised entry by other persons. A notice detailing the closure of the station has been posted on the door of the building, and the same notice has been transmitted to the packet radio network in New South Wales. The Division's solicitors have advised that the station closure was an appropriate action in view of all the circumstances which, apart from

the action over the packet BBS, involved breach of the Division's station licences.

Those involved in the unauthorised broadcast of the 2nd of January include: Councillor Cesar Miranda VK2TCM, Steve Pullan VK2QZ and David Horsfall VK2KFU.

However, yesterday afternoon, the VK2RWI voice repeater was restored to operation for the use of WICEN in support of bushfire operations around Sydney.

DIVISIONAL NEWS.

Council, or at least the majority of Council, regrets that the actions of a few have disadvantaged the majority of members.

A major goal of most of those elected to this Council last May was to clean up the Division's operations, policies and procedures; to put the Division on a proper footing in all aspects of its operations.

It is very sad for the Institute that we have been forced to take these steps owing to the acts of people who, for quite erroneous reasons, believe that they have rights superior to the other members of the Institute and superior to the management of the Division, which is a company.

This Council has had to battle many such acts by some members and, worse still, some Councillors, since the AGM last May, and it has continued despite the caution about acting within the law President Terry Ryeland gave to people in his speech on the last broadcast for 1993 on December the 19th, and his plea for reason and sanity to prevail. They should heed not just the law, but the spirit of The Amateur's Code. The actions of just a small group of people, including some Councillors, have virtually hijacked the business of the Council and simply wasted the resources of the Division, the efforts of volunteers and interfered with the proper management of the Division - all without a skerrick of mandate from the membership.

It's time it ceased.

Honourable people offer assistance to the Division when the organisation needs it, not interference with its business. Thanks must go to those Councillors and volunteers who maintain the Division's operations for the benefit of the whole membership.

The agreement which was drawn up at the recent ATV forum, held on the 17th of December was delivered to Council by Peter O'Connell VK2EMU, who chaired that forum. Council discussed aspects of the agreement which has been referred to the new Technical Advisory Committee.

Council noted a letter of resignation from the broadcast coordinator, Steve Pullan VK2QZ.

The broadcast team and arrangements for broadcasts are to be re-formed. Broadcast team members will be advised this coming week.

And that's it for Divisional news.

Message from the President Terry Ryeland VK2UX.

"The efficient conduct of the Division's business is being adversely affected ..... and I call upon ALL COUNCILLORS - AND all Divisional volunteer workers - to bear in mind the interests of the members and the Division. They come first.

"In taking up our positions, we all owe a duty to the Division and the members, and we should not allow any dispute or difference of view or opinion to affect the discharge of those duties.

"I remind Councillors and Office Bearers that your actions are subject to the general law, including law relating to defamation.

"There are constructive ways to resolve differences, and that does not include the unruly disruption of Council meetings.

"Council meetings are the primary forum for conducting the Division's business. Let us get back to that business - the business of providing services to members and to the amateur radio community at large.

"Differences can be aired at private committee meetings. The resolution of conflict is best done through constructive action, not destructive disputes.

"Let us take this opportunity to take heed of the spirit of the season, and look to our duties and our differences and resolve to act in the interests of the members and the Division and to put value and pride in belonging to this could-be-great organisation."

COUNCIL MEETING IN WOLLONGONG

Following a requisition by Councillor John Simon VK2XGJ, Council held a meeting on Tuesday January the 4th at Wollongong SES Headquarters.

John nominated the date, the time and the place of the meeting, as he is quite properly able to do under the Corporations Law. He was aware that the Institute has some deadlines to meet regarding the business of the Division and, with that in mind, requisitioned the meeting under Articles 29 and 30 of the Division's Articles of Association. Notices were posted on December the 29th.

On Friday, December 31st, the Division was served with a letter from a solicitor, John Gillmour, acting for Councillors Cesar Miranda VK2TCM, Roger Henley VK2ZIG and Bob Yorston VK2CAN.

The solicitor acting for these three Councillors sought to prevent the meeting going ahead.

The letter was referred to the Division's solicitors who replied, pointing out that the meeting was properly requisitioned, notices were properly served and the Council had urgent business to consider by or before that date.

An action to injunct the holding of the meeting, threatened by the solicitor for Councillors Miranda, Henley and Yorston, did not eventuate, and the meeting went ahead as planned.

Present were: Terry Ryeland VK2UX,
John Simon VK2XGJ,
John Robinson VK2XY,
Julie Kentwell VK2XBR
and Roger Harrison VK2ZTB.

Councillors Cesar Miranda VK2TCM, Roger Henley VK2ZIG and Tim Mills VK2ZTM were absent. No notification of their absence was lodged either at the Division or with the Secretary. Councillor Bob Yorston had notified his absence to the Division on the 21st of December.

There were 17 visitors present, coming from the Illawarra region, the South Coast, the Blue Mountains and Sydney.

Council first dealt with the business before the meeting adjourned from the 17th of December, which was requisitioned by Councillors Cesar Miranda VK2TCM, Roger Henley VK2ZIG, Bob Yorston VK2CAN and Tim Mills VK2ZTM.

That business involved a motion of no confidence in the Secretary Roger Harrison VK2ZTB and a motion seeking to dismiss him from all positions. That meeting was adjourned by President Terry Ryeland when it became unruly.

The motion of no confidence was defeated by a vote of five-zero. Terry Ryeland, on advice from Institute solicitor David Lewarne, ruled the motion to dismiss the Secretary out of order as it contravened Article 51 of the Division's Articles of Association.

The reasons for the no confidence motion and dismissal advanced by Councillors Henley and Miranda were found to be unsubstantiated.

Also, at the meeting of January 4th, Council set the date for the Extraordinary General Meeting which was requisitioned on the 5th of December.

The EGM will be held on Saturday the 26th of February, at the Doonside Community Centre, where the November EGM was held. It will open at 2.00 pm, or 1400 hours local time. Official notice of the EGM will appear in the February issue of AR magazine.

Note that the 26th is the day before the Central Coast Field Day at Wyong.

Another important item on the agenda was the Division's insurances. The insurance schedule is to be referred to an assessor in order that all

the values of property to be insured are up to date. Council is due to finalise choice of insurance broker and insurer at its meeting scheduled for the 21st of January.

Council noted a letter of resignation from the Chairman of the NSW Technical Advisory Committee, Cesar Miranda VK2TCM. In his letter, Mr Miranda alleged that Council was exercising too much control over NTAC.

Council, while accepting Mr Miranda's resignation, did not accept the reason. It was pointed out that quite a number of applications regarding repeaters were waiting to be passed to Council for approval before sending to the SMA, some being outstanding for more than four months. It was also revealed that there were a series of letters of complaint to the Division from three affiliated radio clubs about inaction by NTAC.

Council pointed out that there were TEN Council meetings between the start of October and the end of December at which approvals could have been placed before Council. It was also pointed out that an NTAC Report is also on the standard agenda for each Council meeting, providing an opportunity for approvals to be passed by Council.

No action was taken by Cesar Miranda, the then Chairman of NTAC to put approvals before Council. Hence, his allegation of "control" of NTAC by the Council was rejected as untrue.

He did not submit approvals for the meeting of January the 4th.

As a result, Council then appointed John Simon VK2XGJ as Chairman of NTAC. He was given the responsibility to obtain all outstanding repeater applications and all NTAC files, to find willing volunteers to serve as members of NTAC and to report to the Council meeting scheduled for the 21st of January.

Telecom donates FM-828 transceivers to the VK2 Division.

On a happier note, the donation of more than 500 FM828 VHF transceivers to the Division by Telecom was announced at Council's January 4th meeting in Wollongong.

The official handover took place on the 21st of December. Well-known amateur Dick Smith VK2DIK accepted the donation on behalf of the Division, from Mr Charles Zoi, manager of Telecom marketing in Sydney.

The ceremony took place at the headquarters of Australian Geographic in Terrey Hills. Vice-President John Robinson VK2XY and Secretary Roger Harrison VK2ZTB attended for the Division.

Council will determine the disposal of the FM828s at its meeting on the 21st of January.

WICEN News

As listeners may already be aware, WICEN has been active in providing support for bushfire fighting operations.

According to information gained earlier this evening, WICEN has been called out on the South Coast, in Sydney South, Sydney North, in the Hunter region and the Central Coast. Apparently, Mid-North Coast WICEN is on standby.

State Emergency Services communications has failed in the Central Coast and WICEN has completely taken over communications for them.

Thanks to John Howard, WICEN State Coordinator, for that news.

IPS REPORT

Here is the IPS Weekly Report, courtesy of IPS Radio & Space Services.

This report was issued on the 7th of January and covers 31st December to the January 6th.

First the ionospheric indices:

These are for 31 December, 1st, 2nd, 3rd, 4th, 5th and 6th January,

The 10 centimetre flux: 141 148 146 133 129 137 132

Now the A index: 16 21 19 13 6 5 10

Finally, the T index: 116 51 46 55 73 80 86

Summary of activity: solar activity was low on New Year's eve, very low on New Year's day, high with an M-class solar flare on January the 2nd, and low on January the 3rd. On January 4th, solar activity was again very low, rising to moderate on the 5th and returning to low on January the 6th.

Ionospheric critical frequencies were enhanced by at least 15 per cent and up to 30 to 50 per cent from December 31st through to January 6th. Strong sporadic E was observed every day from December 31st through to January 4th.

Forecast for the next week, 7 to 13 January is as follows:

Solar activity - low,

Geomagnetic activity - quiet with a possible active period on 12th-13th January. Ionospheric critical frequencies are expected to be near normal or enhanced by 10 to 20 per cent.

Thanks to the IPS Radio & Space Services for that report.

SILENT KEY

We record the passing of Reginal V. Bulman VK2YL

Reg passed away suddenly in Armidale Hospital on the 16th of December, following an extended illness. Apart from his last call, Reg previously held the callsigns VK9RL and VK4YL.

Born in Tasmania in 1912, he became interested in radio in 1921, at the age of nine. His interest was sparked by an Uncle who was an Infantry Signalman in World War 1.

After leaving college in 1930, Reg was employed installing and servicing radio receivers, as well as doing electrical wiring of homes and businesses. In 1938, he attended a Radio Mechanics course plus a course for his Amateur Operators Certificate of Proficiency.

He joined the Citizens Military Forces as a signalman in 1940, later being transferred to the RAAF as a radio mechanic. Reg served in New Guinea during World War 2.

After the war, Reg joined the then PMG (now known as Telecom), with whom he remained for 22 years.

Reg's widow, Elsie, writes:
"I shall always cherish many happy memories of Reg's generous help with his technical skills, to me, and the community at large; unforgettable times with tape recorders, cameras and projectors, the Scout Jamboree-of-the-air. He must have made a multitude of friends in the ham world."

Item submitted by Reg's wife, Elsie Bulman.

MEMBERSHIP RECRUITMENT & RETENTION CAMPAIGN

HOW WOULD YOU LIKE TO WIN A BRAND NEW RIG?
Members who renew, or non-members who join up between the 1st of December 1993 and the 28th of February 1994 will be eligible to win a new rig from Kenwood.

First prize will be a TM-241A 2m, 50 watt mobile rig, while second prize will be one of the very new TH-28A 2m, 5 watt handheld rigs. Total value of the prizes is over $1400.

There are no special forms to fill in or convoluted quizzes to answer - all you have to do is either join, if you're a non-member, or renew if you're already a member. If your renewal does not fall within this period, no matter - you can renew early! If you do renew early, please do it through our Administrative Secretary, Margaret Morris, NOT through the Federal Office in Victoria.

Both prizes will be awarded by way of a draw and presented to the winners at the earliest opportunity this year after the close of the promotion.

Thanks go to Kenwood Electronics Australia who have generously sponsored the promotion by donating the prizes.

So, if your membership renewal falls due between 1st December this year and 28th February next year, or if you're considering joining - DO IT - you could be one of two lucky winners.

All grades of membership are eligible. Members currently on a three-year term will be included in the draw, as will life members.

A reminder about the Extraordinary General Meeting.

The EGM will be held on Saturday the 26th of February, at Doonside Community Centre, where the November EGM was held. It will open at 2.00 pm, or 1400 hours local time. Official notice of the EGM will appear in the February issue of AR magazine.

Note that the 26th is the day before the Central Coast Field Day at Wyong.

UK MORSE CODE SURVEY:
Through late-1992 to March 1993, The Radio Society of Great Britain conducted a survey concerning the requirement of Morse Code as part of the British licensing examinations, particularly canvassing opinions on a "Code-free" HF licence. The RSGB has published a detailed, three-page report in its December 1993 issue of the society journal, Radio Communication. It makes fascinating reading.

By the closing date of March 8th last year, the survey had generated a total of 1413 replies from the UK and 86 from outside the country. The report, titled "To Key or Not to Key?", noted that the raw data, "...shows that on this occasion there is a two-to-one majority in favour of retaining the Morse test as a means of access to the amateur bands below 30 MHz."

The report further noted that the majority of those wishing to retain the Morse test were Class A licensees (who have full priviliges, equating to our full licensees), while the majority of those wanting to do away with it were Class B licensees (limited, no-code, VHF and up). In addition, "...of the 86 letters received from overseas there is a much higher proportion in favour of retaining the Morse test," the report noted.

Of those replies expressing a view, 67.5% voted 'no' to a code-free HF licence, while 32.5% voted 'yes'. More shortwave listeners replying to the survey voted 'yes' to retaining the Morse test than voted 'no'.

In summing up, the report said, "Gone are the days when a knowledge of Morse code was considered essential for communication between radio amateurs.

"However, CW has been used, even in recent years, by other Services to communicate with amateurs and it is used, for example, to identify marine and aviation beacons.

"For a long time, it has been accepted that the Morse test does provide a limiting effect on the number of radio amateurs using the finite resource of the HF amateur bands."

Further, the report concluded that Morse code proficiency demonstrates a practical skill, "...which is certainly relevant to amateur radio, but acquiring this skill will put some at a disadvantage.

"However, few would dispute the fact that practical skills are an important facet of amateur radio."

Noting that relevant knowledge and practical skills are required, the report said, "There are some useful arguments both for and against a Code Free Licence.

"It is primarily up to the amateur community World-wide, and its representatives, to determine what qualifications are necessary and what standards need to be met to gain different types of transmitting licence."

The RSGB pointed out that the views expressed in the report do not represent RSGB policy. A ten-point table of "perceived benefits of Morse Code" was included with the report in Radio Communication magazine and cited the mode's narrow bandwidth advantages; its ideal nature for low power communications; advantages for beginners in simple, low cost equipment; the use of Morse in developing nations; lack of language difficulties and its advantage as the lowest common denominator for emergency communications.

IPS REPORT

Here is the IPS Weekly Report, courtesy of IPS Radio & Space Services.

This report was issued on the 14th of January and covers the 7th to the 13th of January.

First the ionospheric indices:

These are for January 7th, 8th, 9th, 10th, 11th, 12th and 13th respictively.

The 10 centimetre flux: 126 123 117 110 101 98 95

Now the A index: 5 5 2 3 16 20 20 forecast.

Finally, the T index: 68 89 53 77 72 30 59

Summary of activity:
solar activity was moderate on the 7th with an M-class solar flare at 0943UT. It was active to very low on the 8th and low on the 9th. Activity fell to very low from the 10th through the 13th.

Ionospheric critical frequencies over Sydney were enhanced by between 10 per cent and up to 40 per cent from the 7th through the 11th when the critical frequencies fell to predicted monthly values before falling to 15 per cent depressed after 1700UT. On the 12th they rose to near predicted monthly values and were enhanced by 15 to 40 per cent for a period on the 13th.

Forecast for the next week, 14 to 20 January is as follows:
solar activity - low to moderate,
geomagnetic activity - quiet to unsettled.
Ionospheric critical frequencies will be mostly 10 to 20 per cent above monthly predicted values.

Thanks to the IPS Radio & Space Services for that report.

CLASSES
Get your ticket! Classes for those wanting to study for their licence examination will be held at Amateur Radio House again this year, starting on Monday February 7th. Be there at 7.00 pm.

The classes are conducted each Monday night over a period of 40 weeks, public holidays excepted. A licence exam is scheduled for just after the course ends.

EXAMINATIONS

The next licence examinations to be conducted at Amateur Radio House in Parramatta will be on February 20th. Avoid the rush, get your applications in now.

This year, apart from February 20th, examinations will be held on the 9th of April (the day before the Divisional AGM), the 15th of May, the 26th of June, the 7th of August, 18th September, 30th October and the 11th of December.

Thanks to Jim Walker VK2XJW for that information on classes and exams.

DIVISIONAL NEWS

For the benefit of those who missed last week's broadcast, in part or in whole, either because we only went out on limited frequencies or because the transmissions suffered from deliberate jamming, particularly to the evening broadcast, we are repeating much of the information broadcast last week.

For those who know "the whole story", please bear with us.

CLOSURE OF THE DURAL STATION

Two recent events have brought about the closure of the Division's Dural station. On Friday, December 31st, the Division was served with a letter from Solicitors Marshall Marks Kennedy, acting for Ms Val Bergman.

The letter alleged that she was seriously affronted by two packet radio bulletins which named her, transmitted to the Division's Bulletin Board VK2RWI on the 28th of December under the callsign of David Horsfall VK2KFU.

We must point out at this stage that Val Bergman is married to the Divisional Secretary, Roger Harrison. Val's full surname is Bergman-Harrison.

In addition, the solicitor said that the bulletins were defamatory of her and pointed out that, under the Radiocommunications Act, the Division's station licence was subject to a condition that the station could not be operated, or permitted to be operated, in such a manner.

The Division was given until 5.00 pm on Friday the 7th of January to undertake to prevent such transmissions via the VK2RWI BBS in the future, or else an injunction to stop its operation would be sought. In addition, an action seeking damages for defamation was threatened.

This resulted in a decision to take the VK2RWI packet BBS off-air for the time being. Vice-President John Robinson VK2XY handled this legal business for the Division as Secretary Roger Harrison declined owing to his relationship with Val Bergman.

This action is very serious indeed, not only for the Division, but consequently for all packet radio BBS operators, users of packet radio and the entire amateur radio service.

So what is a defamation?

It is anything in writing which attacks or injures the "good name" or reputation of someone, either directly or by inference.

One of the packet bulletins complained of, alleged that she had sold a secondhand 9-pin dot-matrix printer to the Division for the unrealistically high figure of $350. The allegation made in the packet bulletin, under the callsign of David Horsfall VK2KFU, is known to be totally untrue, as the Division's accounts will testify.

Other bulletins were complained of but the one just detailed illustrates the issue.

The Division, and any other packet BBS operator, is a "knowing publisher" of whatever is posted to the packet BBS. Anyone who may be knowingly involved in the publication of defamatory material can be enjoined in a defamation action and thus includes ALL BBS Sysops who may subsequently carry defamatory items on their BBSes.

That action only affected the VK2RWI packet bulletin board.

However, on Sunday morning the 2nd of January, there was a broadcast made from Dural, which was purported to be an "official" broadcast. The text of that broadcast was also transmitted as a series of bulletins to the packet radio network under the callsign of VK2WI.

Those involved in that broadcast of the 2nd of January include:
Councillor Cesar Miranda VK2TCM,
Steve Pullan VK2QZ
and David Horsfall VK2KFU.

No broadcast was scheduled for the 2nd of January. Indeed, the then Broadcast Coordinator Steve Pullan VK2QZ [sic] had informed Council that the first broadcast for the year would be on January the 9th.

[NB: VK2QZ is _not_ the Broadcast Coordinator. DH]

These voice and packet broadcasts contained material which is untrue and would likely mislead members and other listeners. The fact that the Divisional News content was purported to be "official" could also mislead members and other listeners as to the Division's true position and actions.

For example, the resignation of the Chairman of NTAC was not known to Council prior to the broadcast and the reason he gave, saying that Council was exercising too much control over NTAC, is quite untrue, as came out at Council's meeting in Wollongong on the 4th of January.

No control was exercised by Council. Over the three months from October to December last year, there were ten Council meetings at which he could have raised and had passed repeater applications and did not do so.

The fact that no broadcast was scheduled and that material was broadcast of which neither the responsible Executive Officers or the Council had any knowledge in the ordinary course of business before it was broadcast, in addition to untrue material likely to mislead listeners, the broadcast was therefore unauthorised.

This is a breach of the Division's licence conditions.

Unconditional authority is not given to those appointed to organise broadcasts.

We might also point out that unauthorised use by an amateur of anyone else's callsign is a breach of their own licence conditions.

In view of these serious events, and following considerable discussion among the President, Vice-President, Secretary, and two other Councillors, being a majority of the Council including the executive, firstly, the Institute's packet radio bulletin board system VK2RWI, was removed from Dural on Sunday 2nd January 1994.

In addition, the other transmitting equipment at Dural was secured against unauthorised use and the lock to the building changed as the broadcast of the 2nd of January was not the first occasion there was an

unauthorised broadcast. Others were made on the 12th and 19th of December.

A notice detailing the closure of the station has been posted on the door of the building, and the same notice has been transmitted to the packet radio network in New South Wales.

The Division's solicitors have advised that the station closure was an appropriate action in view of all the circumstances.

However, the VK2RWI voice repeater was restored to operation on Saturdy the 8th of January for the use of WICEN in support of bushfire operations around Sydney.

We aim to have the Dural station back in operation as soon as possible. The broadcast team and arrangements for broadcasts are to be re-formed. More details on action plans for Dural will be given in coming broadcasts.

It is unfortunate and regrettable that we have been forced to take these steps owing to the acts of people who, for quite erroneous reasons, believe that they have rights superior to the other members of the Institute and superior to the management of the Division, which is a company.

Next Council meeting

The next Council meeting will be on Friday the 21st of February [sic].

Following an invitation from the Westlakes Radio Club, the meeting will be held at the Westlakes Club rooms, at 1 York Street, Teralba, just south of Newcastle.

The Club's invitation to Council was received on the 5th of January. Notices to all Councillors were posted at the end of last week.

Listeners may be aware that Westlakes operates the VK2 Inwards and Outwards QSL Bureau on behalf of the Division. Council has not made an official visit to Westlakes for some years.

COMING EVENTS

Next Divisional Council meeting . . . . . 21st January
- note that it will be held at the Westlakes Club in Teralba.
Divisional Trash & Treasure Sale . . . . . 23rd January
Packet Radio users meeting at Amateur Radio House. . . 23rd January
Amateur Licence Classes at Parramatta, start . . . 7th February
WICEN (NSW) Committee meeting. . . . . 12th February
AATC meeting . . . . . 13th February
Licence Examinations at Parrammatta . . . . . 20th February
Divisional EGM . . . . . 26th February
Central Coast Field Day at Wyong. . . . . 27th February
Closing date for the Division's AGM . . . . . 27th February
Daylight Saving ends . . . . . 6th March

Bungonia Cave Rescue (WICEN). . . . . 19th & 20th March
AATC Workshop. . . . . 20th March
Divisional Annual General Meeting . . . . . 10th April

The Councillor on duty at Parramatta next Wednesday the 19th of January,
is Julie Kentwell VK2XBR.

360. ICOM-R1 frequency shift?

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-19 02:33:39 UTC

Sometime ago a problem appeared in my ICOM R1 receiver. If I move the tuning knob while the radio is off, one of the memories (it only has 2) will be shifted by -16 kHz, in other words if it was tuned at 6060 it will appear at 6044 next time I'll turn it on. The other memory is fine, remaining at whatever frequency was. If I don't move the knob, the frequency will remain undisturbed. Did anybody experience anything like this? Thanks,

Dan.

In addition to N2VDS's good reply, don't forget also that the morse test is strictly a LISTENING test, so if your friend can write or (as is commonplace nowadays) do a multiple-choice test then he just has to listen to the test to take it. Also, I believe that VE's are required to make any reasonable accomodations for handicapped people, provided they are notified in advance. Best of luck to your friend in his endeavor!

>
>Many people buy kits because they can't afford assembled. If they can't afford
>assembled, how can they afford the test gear to get a poorly designed kit to
>work?

Heath idiot proofed their kits. They weren't better designed than their competition, and they certainly weren't cheaper, but they were designed to be easily built without tricky alignment or the need for special test equipment. If you want cheaper than assembled equipment, you are going to get kits that aren't perfect. Today's assembled gear costs less than a quality kit, as Heath discovered to their bankruptcy. The original Heathkits were paper bags of parts and a mimeographed sheet of instructions. In the days of simple hand wired tube factory gear, that was cheaper than assembled. But today with complex machine assembled products, a kit that's going to work as well, and is fool proof to assemble, is going to cost *more* to produce and market.

People who buy kits thinking they'll save money are fooling themselves. With a quality kit you're going to pay *more* for the priviledge of doing the

assembly, or you're going to get a kit that requires you to be your own test engineer, and sometimes redesign engineer. That's not bad. It forces you to learn a lot more than the "insert leads A and B in terminal 3, solder two" of Heathkit days where all you learned was how to follow directions. Think of a kit as a more convienent way to do homebrew construction.

363. FT-530 Receive Problem

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-19 03:15:30 UTC
From: leber@panther.warm.inmet.com
Message-ID: <CJux1u.EDx@inmet.camb.inmet.com>
Source record: 272181

OK 530 owners, in the past, I've seen posts about receive problems in the 2 m. range. I need some feedback (no pun intended) about this.

Some background:
I bought a new 530 recently. It exhibits interference on the output of a local repeater (145.130). A fellow local Ham had a similar experience on the same frequency. I talked to Yaesu about it, explained that I had heard of others having problems, etc. They said to send it in. I did. When it was returned, the problem was still there.

The work order read as follows:
"Performed 2M update modification, shielded the RF unit, added flex cable to the antenna BND connector, installed upgraded VFO knob, adjusted and tested unit to factory specifications"

(They also performed the extended receive mod at no charge at my request while they had it open. Nice guys.)

The problem: a noise resembling fast ignition noise centered around 145.14 or so, extending up and down from about .125 to .150. If I sweep upward, the noise seems to come and go about every 500 kHz. While it can be difficult to hear in the white noise of dead air, it can become quite pronounced when heard over a carrier of less than full quieting on the same frequency.

This noise is also heard in other HT's held in close proximity to the 530, and ceases when the 530 is shut down, so it pretty much has to be coming from the 530.

Has anyone else experienced this? I have talked to 3 other 530 owners, and 2 who owned older (~1 year old) units have no problem, while the other, who purchased his about the same time I did, had the same symptoms. He has returned his unit to Yaesu also, but has not received it back yet.

I have talked to the Tech. Support Supervisor at Yaesu, and he is looking into it. (Things are a bit hectic out there. They are near the earthquake zone, and while they did not have structural damage, the parts department was pretty much trashed).

I'm trying to get a feel for whether this is a problem with all recent production 530's, or just a few, one run, etc.

Can anyone help? Thanks and 73.
Tom, N3QKV

>clear and significant risks that we all take every day, any risk is obviously
>insignificant.

That's absolutely true. People need to get a grasp of proportion when it comes to evaluating risks. There's no such thing as a risk free activity or product, but ham radio is safer than skydiving, or driving a car. It's probably safer than drinking milk, certainly safer than taking asprin. This is a case similar to nuclear power. The risks of nuclear power are tiny compared to the known risks of coal fired generation, yet the latter is accepted while the former is feared. The *possibility* of an invisible threat frightens the ignorant more than the visible threat of the known.

>Interestingly, a clearly documented producer of cancer in both animals and
>humans is excess caloric intake, and when I look around a lot of hamfests, if
>there is excess cancer in hams, that may be the reason rather than exposure to
>EMR.

Actually, it's dietary fat intake that's the supposed risk factor, not the calories themselves. On the other hand, Eskimos have the lowest incidence of heart disease and colon cancer of any studied group, and their diet is extremely high in fat. Go figure.

>None of the power line studies of which I am aware have been
>adequately controlled for such things as socio-economic status, etc., but
>places such as New Jersey are apparently nevertheless rushing to impose taxes
>on emitters of EMR on the theory that EMR is carcinogenic. I have even heard

>Antenna season approaches....

Well of course Rohn sells gin poles and hardware. They're rather proud of them, however, got to pay that liability insurance. I bought a kit from a fellow in the flea market at Dayton last year. Good sturdy construction, but not quite as slickly engineered as Rohn's product. Only cost $49 though, I couldn't build one myself that I'd trust for less. It's your life of course, but Rohn makes the best. Unless you have access to magnaflux equipment, which I do, I'd be somewhat leery of using the product of some garage shop. Fall on your head it might.

366. DSP Audio Filters

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-19 04:18:16 UTC
From: hamilton@BIX.com
Message-ID: <hamilton.758953096@BIX.com>
Source record: 272316

Yesterday, I spent a good part of the day at the HRO store in Salem, NH and came away rather impressed with the "digital" audio filtering in the Yaesu FT-990. Never mind that the 990's filtering isn't really digital -- it was, nonetheless, impressively effective at cleaning out all the junk in a CW signal so that all remained was a nice, clean tone.

That's got me thinking that perhaps one of the genuine DSP-based filters like the Timewave DSP-59 might be even more amazing. The ads claim the ability to filter out white (uncorrelated) noise + do tight bandpass filtering. I'd love to hear comments from anyone who's got one or from others who've actually listened to the effects. (Unfortunately, HRO did not have one there on display for me to try yesterday.) Are they worth the money? At $169 for the basic DSP-9 or $299 for the DSP-59, we're talking the kind of money that could buy one or two xtal filters... this is apples and oranges, but just so I get a feel for their relative effectiveness, which offers more bang for the buck, do you think?

367. Yaesu FT-890AT

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-19 04:28:31 UTC
From: hamilton@BIX.com
Message-ID: <hamilton.758953711@BIX.com>
Source record: 272317

After playing with it for some time yesterday at the local HRO, I came away strongly leaning toward the Yaesu FT-890AT. I should tell you I'm just getting started again with ham radio after having been away from all this since high school 25 years ago. My interest, at least initially, is just building up skill levels, meaning, particularly, CW. I'm a software type so I'm also intrigued by computer control and data (rtty and packet).

What struck me about the 890 was several positive points: I liked the physical packaging a LOT. Very nice, attractively laid-out control panel (though w/o a 10-key pad). Very small footprint, meaning I wouldn't be struggling to figure out how to make room for it. Operation seemed to be quite simple and I did like what I could see of its performance, comparing it there against more expensive units like the 990 and 1000. And finally, while I'm not really price-sensitive (meaning that if I could convince myself I really, really, just HAD to have the most expensive thing there, price would not stop me), it certainly does strike me that it might be nice to leave some money instead for a 2m rig + TNC for the local packet BBS and other goodies.

I have looked thru the QST Reviews (btw, if there are some of you who are thinking of buying a rig but haven't bought the 2 volumes of collected QST reviews, you should buy them now) and the 890 certainly does seem to get good marks.

But let me ask the real question: is there any reason I _shouldn't_ buy the 890? Are there some shortcomings (like maybe the lack of an adjustable IF bandwidth or whatever) that you think I should be giving thought to before I go off and buy this unit? Have any of you bought one and been dissatisfied? Why? Any comments would be much appreciated!

Regards,
Doug Hamilton hamilton@bix.com Ph 508-358-5715

NOTE: The Effective Sunspot Number for 17 JAN 94 is not available.
The Full Kp Indices for 17 JAN 94 are: 4o 5- 4- 4- 2- 3o 3o 3+

SYNOPSIS OF ACTIVITY

Solar activity was low. Region 7654 (N08E46) remains the
most active region on the disk. Five optically uncorrelated
C-class flares were observed this period, most likely
originating from this region. Magnetic inversion line analysis
indicates 7654 has developed a beta-gamma-delta configuration
while maintaining its overall size and shape. Region 7656
(S22W08) was numbered this period as an AXX spot group. All
other regions quiet and stable.

Solar activity forecast: solar activity is expected to be
low. Region 7654 is forecast to continue producing C-class,

and possibly M-class activity.

STD: The National Solar Observatory has confirmed that Region 7654 is associated with extremely intense Ca XV emissions. Intense emissions were observed on 16 and 17 January. These emissions reduced to moderate levels today. The group has been relatively quiet over the last 24 hours, but remains capable of producing potentially strong activity.

The geomagnetic field has been at mostly unsettled levels with some minor storming experienced from 18/14Z-17Z at middle latitudes. Levels have been quiet to unsettled since. High latitudes were at mostly unsettled to active levels with some major to severe storm levels recorded from 18/14Z-17Z. Levels have calmed down to mostly unsettled to active since.

Geophysical activity forecast: the geomagnetic field is expected to be mostly unsettled at middle latitudes with unsettled to active levels expected at higher latitudes.

Event probabilities 19 jan-21 jan

Class M 40/40/40
Class X 05/05/05
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 19 jan-21 jan

A. Middle Latitudes
Active 25/20/25
Minor Storm 05/01/05
Major-Severe Storm 01/01/01

B. High Latitudes
Active 35/25/30
Minor Storm 15/10/10
Major-Severe Storm 05/01/05

HF propagation conditions were again near-normal over the low and middle latitudes today, and below-normal to near-normal over the high and polar latitudes. High and polar latitude paths (particularly night-sector transauroral circuits) observed additional periods of minor signal degradation. No changes are expected. Middle and low latitude paths should continue to see near-normal propagation, while high and polar latitude paths are expected to see periods of minor signal degradation during night-sector signal transits. There remains a moderate risk for potentially strong SWF activity on daylit circuits.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

369. Re: Wanted: Morse code software

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-19 04:47:51 UTC
From: hamilton@BIX.com
Message-ID: <hamilton.758954871@BIX.com>
Source record: 272289

If you're looking for a good software package for Morse code training, be sure to look into SuperMorse by Lee Murrah, WD5CID. It's a shareware product available on a lot of BBoards or direct from the author at 10 Cottage Grove Woods, SE, Cedar Rapids, IA 52403 if you send him a formatted diskette and a self-addressed stamped mailer. Suggested registration fee is $20.

I found SuperMorse very helpful in getting me started with the basics of learning the characters, though I admit my wife quickly got pretty fed up listening to the sound coming the speaker on my PC, forcing me to do a quickie mod to put in a headphone jack.

But I do admit that after a while, it seemed like SM was training me really well to press keys but not so well to actually recognize the sounds of the characters. On the whole, I think the ARRL tapes really have done a better job of pushing me along with a series of drills, each just a little bit faster than the previous. After only a little over a month, I'm now finding that I can pretty comfortably copy up to about 8 wpm on ordinary text and then lose it at about 9 wpm. But each day, it gets a little better. (Still can't do very well on the random character drills, of course, but that's to be expected, I suppose.) Frankly, I didn't really expect to be doing that well so quickly and view that as quite a good testament to the quality of the ARRL tapes. Start with the "Your Introduction to Morse Code" and the "Increasing Your Code Speed: 5 to 10 WPM" tapes. I think you'll be quite pleased with the results.

Fred, your QRZ! CD is super! I love it. But I found that (under NT on my DEC Alpha) the fonts used in the Windows GUI front-end to your callsign database were really only marginally readable. The DOS character mode version was much more usable, simply because it was more legible. What's going on? What kind of font did you use and can you fix it in your next release, perhaps?

But let me stress for the benefit of those who have not yet seen the QRZ! CD that this really is a minor complaint. The WinHelp wrapper is very good. You've done it again (just as you have with every other CD I've ever bought from you)! A great value. Keep it up!

From: jhulten@u.washington.edu
Message-ID: <2hihn7$1vs@news.u.washington.edu>
Source record: 272297

Actually, I would think the instances of brain tumors from rf in Hams
would be low because we all understand the dangers. I would think
looking at the use of cellular phones (by people who don't have a clue)
and see if you can correlate cell phone use with brain tumors. I can see
twenty years from now a ton of lawsuits against McCaw Cellular because
the product didn't carry a warning label..

SURGEON GENERAL WARNING!
Using cellular phones may
cause brain cancer!!!

375. Ham Radio FTP area on World

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-19 06:54:52 UTC
From: wy1z@netcom.com
Message-ID: <rec.radio.info-ham.radio.ftp_758962491@ve6mgs.ampr.ab.ca>
Source record: 272221
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.info,rec.radio.scanner

This is a periodic reminder that the Boston Amateur Radio Club maintains an FTP area on world.std.com (192.74.137.5) in pub/hamradio.

This area is accessible via: anonymous ftp, gopher, and World Wide Web (and possibly other methods I'm not yet aware of). World is not *fsp*-able yet (I asked them).

Via Gopher, the easiest path to the area is by selecting the following from World's main menu:

18. Membership and Professional Associations

3. Boston Amateur Radio Club

And go from there...

Please feel free to browse through the area.

If anyone has any questions about it, please do not hesitate to e-mail me.

Also, up-to-date copies of the files on the ARRL's information server (info@arrl.org) are available in the directory pub/hamradio/ARRL/Server-files.

All text files are uncompressed, so they are both retrievable and viewable via Gopher and World Wide Web. (If you have any troubles with any text file, please e-mail me).

Source code for programs is always welcome. It can permit people to use those programs on other computers with other operating systems.

Scott

>objects, a broad somewhat flat area is best, have antenna vertical).

Yes, I did think of this solution, although for mobile use when I'm on
a train it would not be so good since the antenna would always be
collecting bits of tree or tunnel or bridge or......

In a car it's ideal though.

>(I would have thought the locos would have had built in dashboard radios,
>and an AM/FM cassette player? :-)). Anyway, this would get the RF away
>from your body, and probably improve reception. A 2 meter antenna should
>work reasonably well on radios on 160 MHz.

I wish we had radios and the like as standard fittings, but they aren't.
Unlike truckies, who have CB's, radios, TV's, etc, we have nothing other
than the ridiculous fixed-frequency handheld and my Sony Walkman!

(Now if only I could work out a way to put an external antenna on that
Walkman so I can get better reception from narrowcast FM stations!)....

>Wave to the guy with the camera, he likes to photograph freight trains and
>box cars (he's my brother).

I usually do!

>HT, and always use it. This will let you hold the rig a good foot or two from
>most parts of your body (except the arm holding the rig).

I didn't think of that one! But it's a good suggestion, and very practical
too!

I suppose this along with the other suggestion I've seen so far of a
magnetic mount mobile antenna would make seperating the radiating
element from me much easier in some situations.

What we really need to do is wear German steel world war 2 helmets,
plug the antenna into a socket on top of the helmet, and connect the
earth to the helmet itself. Instant groundplane and good shielding for
one's precious cranial matter!

And if we really get serious about earthing, connect a lead from the
helmet to a copper stake that can be thrust into the soil in a convenient
spot.

Craig, the Freight Raver.

378. Are there any RS232C cards for PCMCIA?

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-19 08:29:22 UTC
From: kitagawa@ee.ES.Osaka-U.AC.JP
Message-ID: <KITAGAWA.94Jan19172922@qed.laser.ee.es.osaka-u.ac.jp>
Source record: 272301
Cross-posted to: comp.sys.laptops,rec.radio.amateur.misc

I am going to buy a laptop or sub-note with only one serial port. But
I need two or even three serial ports in the future. Are there any
RS232C cards for PCMCIA slot? I know there are fax/data modem cards
and Ethernet cards. But so far I couldn't find any serial port card.
If you know, please tell me the model, price, dealer, spec, etc.

I'm also looking for PCMCIA Ethernet cards for 10base-2 (Coax)
[NOT 10base-T].

Thanks in advance.

FYI (to Hams only, probably contesters only):
Why do I need so many serial ports? Yes, I want to run CT (by K1EA) in
multi-multi station. I hope CT ver.9 should support Ethernet.

i stand corrected by someone on sending packet nts msgs into the
los angeles area...if you are outside of california please address
your nts msgs in the following format for packet:
outside california:
st zipcode @ ntsca
qtc cityname,phone prefix
the rest of the msg is in standard arrl radiogram format....

for inside california:
sysops can point all mail bound for san fernando valley/northridge
area to w8akf.#soca.ca.usa or k6ve.#soca.ca.usa....
the major and only bbs for that area is wb6wfh and his system is down
for the next several days i would imagine...he lives at ground zero
of this 6.6 shaker...so once again the format for internal calif. mail:
st zipcode @ w8akf.#soca.ca.usa or
st zipcode @ k6ve.#soca.ca.usa
this is what w8akf has sent out on our local packet bbs network...

thanks for reading....73 de richard n6uzs rclark@easyst.com

Let me check, but at one time I used the exact setup on my HF radio.I
still think I have the original book, I also have the interface too ...try
and find out the model number and I will check.

CW of course, only you'd better be able to copy at speeds greater than
1e+99999 per minute or you won't understand a thing.

Let's face it, God pre-dates amateur radio by quite a few millenia so he's
probably using a spark-gap generator and touching two wires together.

This is incorrect. The correct address to use for
subscribing to the boatanchors list is:

boatanchors-request@gnu.ai.mit.edu

Also, the purpose of the list is to discuss vacuum-tube
communications equipment.

Actually, HD was owned for a time by the American Machine and Foundry company
and that was a mixed blessing...kept the company going, but the overhead of
the corporation also contributed to mediocre bikes. Probably because AMF was
a very diverse company making all sorts of stuff (can imagine the difficulty
of selling Motorcycle R&D to a corporate boss that came up through something
like Cuno filters, Bowling Products or Potter & Brumfield relays and who
probably thought Harley-Davidson was the division that made Roadmaster
Bicycles....)

Message-ID: <759092438.AA07555@psybbs.durham.nc.us>
Source record: 272239

NOVICE CLASS SCHEDULED TO START MARCH 31...
PREREGISTRATION REQUIRED...
HANDS ON TRAINING/CONSTRUCTION OF FIRST STATION
LEARN THE THEORY!!!

TEARA (Triangle East Amateur Radio Association) is scheduling a Novice Class amateur radio class to begin March 31. This isn't your average amateur radio class...We're NOT teaching the technician elements in this class, we're trying to teach CW and technical skills through hands on experience/classroom radio theory classes.
First, soldering skills will be taught. The students will receive a soldering iron and simple tools required in the class as part of their student package.
Simple DC power supply theory will be taught and a basic 12 volt supply capable of powering the RX and TX later in the class will be assembled and tested.
Next, All students will build a 40 meter CW/SSB rx in the classroom. Superhet receiver theory and soldering/assembly skills will be taught. This RX will allow the student to listen to CW on the air along with the CW tapes and classroom practice. The rx is a commercially available monoband 40 meter rx.
The last stage of the program will revolve around the construction of a simple 40 meter CW TX. Transmitter theory will be taught, and crystals will be supplied for the transmitter.
Simple antenna construction will be covered, and the students will prepare their new novice station for the day that their ticket arrives.
This class is not restricted to new prospective hams, and licensed hams who would like to learn radio theory may find this a rewarding class to enroll in. It will allow a person to learn CW, basic radio theory, and learn some hands on construction techniques that will be helpful throughout their ham career.
This class was actually spurrred from questions over the last year or so from new hams who wish to learn how radio works, construction, etc. This definately becomming a lost art, but is how many of us got out start 20 years or so ago. This not a cheap class, as a student will receive: Soldering iron, solder, basic tools, kits for a 12 vold dc power supply, RX kit TX kit, study materials, and CW tapes.
If you're interested, drop a note here or call (919) 554-2154 and ask for Dave. 73 de WB4IUY

The couple of cell sites I've been to had backup generators that start
when power is disabled, or a big battery.

|> I saw a news story where the announcer was suprised to find that cellular
|> phone service was disrupted as well.

Hi Tom.. that 2025 has been a lifesaver with all the ice storms we are having out here. Back to the story..

Actually, my sister, who attends Southern Cal and lives on the edge of campus, lost AC and phones immediately while her house was being wrecked. Her boyfriend is a computer consultant at the school. They give out cell phones to students in labs when they need help and he had one at the house. She called our house at 7:35ET, about 4 minutes after it hit. They then spent the next half-hour passing the cell phone around the house so all the residents (big house, lots of friends) could call home.

I don't know how long it was before cellular went out, but I sure was thankful it was around at least for a while. Or maybe you were talking about the Northridge area since it was closer to the epicenter.

I have been reading Gordon West's No-Code Plus to study for my Tech+, and he mentions using solar panels to provide comms in case of AC failure. This quake is what prompted my original question.. just what do people do on packet or other modes (if anything)?

I always pictured people without phone service writing their names down on a sheet of paper with the area code and telephone number of a relative someone could call. They can do this at, say, a Red Cross center manned with an instant packet station. Suppose, then, that each state could have a single "contact manager" who would agree to receive lists of people within his/her state that need to be contacted. The manager would then re-send appropriate messages to "area code managers" to keep long distance charges down.

Even if the state contact manager level was skipped, each area code manager could easily keep a listing of area code on the left and packet address on the right, to cover emergency comms that spring up in any area of the nation. We're talking one sheet of paper.

Of course, I'm not familiar with AX.25 and other Amateur packet radio, so I don't know how long it would take for a message to propogate from West to East.

But you're right, of course. I would guess that 97% of the general public has at least one misconception about some facet of cellular communication. I once stumbled across a conversation from the NJ Turnpike and when the person called Virginia, the response on the other end was, "I didn't know that thing could reach this far!" OOOOkayyyy.

Someone please explain the "one way in" messages that were described here earlier. Maybe I read it wrong, but it seems to mention mail going into the

Los Angeles/San Fernando valley area. What kind of messages would go IN?
"Hey Bob, we're worried about you out here.." or "Hey Bob, in case you don't
have AC, the news says it really hit the fan by you.." or "Hey Bob, don't take
the 5 or the 14 hyar hyar hyar.." I don't get it.

What is the "best" and/or "most functionally complete" logging program available? The best one I've found is Hyperlog. I need something for long term logging versus contesting, etc. Hyperlog is good but I'd like to find something for Windows.

If there isn't anything comparable for Windows/OS2, I wonder how much business would be out there for such a program? (may be a good project to start)

Thanks and 73,

Brandon AB5LV

: cared to spend rthe effort to make a good product.

And why did they spend the effort? They were forced to by the customers.
Customers -were- the reason for the improvements.

: According to John Ramsey, many kits are sent back to the factory when
: the builder can't get it to work. He told me horror stories of people
: using pipe solder, etc.

That doesn't sound like Ramsey's fault. Should the instructions say "Don't
hit this transceiver with a hammer."?

: I stand by my assertion that Ramsey kits are poorly engineered with
: respect to performance.

They are not as well engineered as they might have been. So the constructive
thing to do is sit and bitch and moan about how bad they are...right?

: if you get a batch that is right on value or 10% high, you'll have a
: deaf receiver.

That's why Ramsey offers a free variable cap upgrade PCB.

: ...mentality is straight out of the 11m linear amplifier crowd,
: where these guys splatter onto 10m and claim nothing is wrong

A Ham running a KW on 20m gets away with splattering 5w onto 10m.
Why doesn't the FCC care about that?

: John is happy to help you make your radio work
: better when it has design flaws, but he's not ready to upgrade the
: design so people won't have problems.
: * Dana H. Myers KK6JQ

Instead of ragging on Internet which Ramsey may not see, how about
convincing John that he needs to upgrade the designs? If more hams
buy his designs after the upgrade you can bet he will do it. But, like
the Corvair, bad publicity can destroy a product even though it was
upgraded to a very good product.

I'm looking for any site carrying the following satellite programs:

P3?.? Not completely sure of the filename, but it begins with P3.

Also, PB and PG something.

This is a relay for a ham friend who does not have Internet access.

And now for something completely different, how do I go about getting
an AMSAT account?

Thanks much!

73,
Scott

|> tx in AM.

OK. As I had said in my post, I had heard it could but had
not verified this.

|> Besides beling illegal (which might make one a bit more circumspect)
|> it is functionaly impossible with the FT530. This radio does not allow
|> user selection of step rates in the 800-950Mc band. 12.5Kc is enforced
|> and cannot be changed.
|> If you can tell me how you may have overcome this limitation, PLEASE DO.

I have been able to search cell phone frequencies using the 12.5Khz
step. One has to bump the frequency on occasion as the FT530
will stop searching one step short of the center frequency. This
does not prevent you from listening however.

I agree, transmission in AM mode is illegal if you do not have
gov't approved equipment and licensing. Listening to cell
phones is legal for me in Canada (although rather boring)...

Who needs a spark-gap generator? Radio waves are electromagnetic
waves, just like light. All He needs to do is to say, "Let there be
radio waves," and there will be radio waves. :-)

I think it ran on a Mr. Fusion (tm) portable fusion generator. The instructions
said not to open the mini-reactor case, otherwise a mini-hydrogen bomb like
detonation would occur, hence, the brilliant, destructive light.

A followup: the Tech. Support Supervisor called me this morning. He discussed the problem with Tokyo, and can't figure out why the fix they made didn't kill all interference. He seems genuinely concerned about it and assures me that this is not typical performance. He is going to have UPS pick the rig up at no expense to me, and they are going to put a priority on getting it fixed right. He suspects there may be a grounding problem, but can't be sure, and doesn't understand how the unit could have gotten past the final checks after the repair.

In any case, he says they will make it right. I'll keep you posted. If you are having the same problem (and one person has already contacted me to say they are), give Yaesu/Cerritos CA a call about it, and mention that you have heard about my situation. The additional data may help us all out.

These are great radios. Let's make sure they are working to the best of their capabilities. If anyone else has experiences to share about this problem and their conatcs with Yaesu about it, let me know. Thanks.

The following paragraph appeared in an article in today's San Francisco Chronicle about what local companies are doing to help prepare for the next earthquake:

Finally, in an attempt to encourage the use of amateur (Ham) radios, which are used by many relief agencies during an emergency, Pacific Bell has reduced the cost of operating a Ham radio to the basic service rate of $8.35 a month. Ham radios are licensed through the phone company.

I called PacBel to ask about this. They didn't have any idea. They realize that they don't license amateur radios, and they also don't rent any kind of amateur equipment. I thought they might be referring to a special rate for phone patches, but they denied knowing anything about that either.

Any ideas? Do other phone companies do anything to encourage amateur radio?

Funny you should mention that; I've spent quite a bit of effort understanding
exactly what the shortcomings of the Ramsey radios re, in particular the
FX-440. I've posted constructive criticism to the Usenet, and, guess
what, John Ramsey called me up! It turns out he wasn't interested in
a thing I had to say, other than to prove to me I was wrong.

>: if you get a batch that is right on value or 10% high, you'll have a
>: deaf receiver.
>
>That's why Ramsey offers a free variable cap upgrade PCB.

Great. How many people know they need the upgrade PCB when they
don't have the equipment to evaluate the performance of the receiver?

>: ...mentality is straight out of the 11m linear amplifier crowd,
>: where these guys splatter onto 10m and claim nothing is wrong
>
>A Ham running a KW on 20m gets away with splattering 5w onto 10m.
>Why doesn't the FCC care about that?

Of course the FCC cares about that, Cecil. You're starting to sound
just like John; tryingto change the subject and confuse the issues to
avoid the hard problems. Why don't you address my real point, which
is: Just because you can talk to someone with a radio, doesn't mean

the radio is adequately working.

>: John is happy to help you make your radio work
>: better when it has design flaws, but he's not ready to upgrade the
>: design so people won't have problems.
>
>Instead of ragging on Internet which Ramsey may not see, how about
>convincing John that he needs to upgrade the designs? If more hams
>buy his designs after the upgrade you can bet he will do it. But, like
>the Corvair, bad publicity can destroy a product even though it was
>upgraded to a very good product.

I returned John's call and spent 1 hour of my time and $$ listening
to John's excuses. I was told that "no improvement can be made to the
Ramsey radios because no one could build them then". I tried, vainly,
to convince John that he needs to sell kits that include the upgrades
rather than expecting people to realize something is wrong and call him.
At the very least, he needs to include documentation in his manuals which
says "when you build this kit, it stands a good chance of not working
well. Please call New York at long-distance rates on your bill and ask
for the free upgrades which will make your radio work the way you expected
it to".

John flat out told me that his designs have been tested and are optimum
given the fact they need to be built from a kit by people who don't
know anything about radio. He shot down every design alternative I
mentioned with "no one could build it". He bad-mouthed other customers
of his *by name*. Maybe he'll start bad-mouthing me by name, too.

Cecil, rather than trying to convince to stop picking on Ramsey kits
for theire technical shortcomings, why don't you convince your buddy
John Ramsey to spend some hard earned cash going to a course on
customer relations? Then he'd have a chance of addressing the real
reasons why his products get bad press.

hamilton on BIX (hamilton@BIX.com) wrote:

: That's got me thinking that perhaps one of the genuine DSP-based filters
: like the Timewave DSP-59 might be even more amazing. The ads claim the
: ability to filter out white (uncorrelated) noise + do tight bandpass
: filtering. I'd love to hear comments from anyone who's got one or
: from others who've actually listened to the effects.

I built one of the original W9GR DSP filters with the multi-filter upgrade. It works fine. The noise-reducing filter greatly reduces fatigue by reducing noise on medium-strength signals. The narrowband CW/RTTY/AMTOR/etc. filters do a great job, for an audio filter.

Of course any audio filter, analog or digital, has a fundamental limitation: Signals within the radio's IF passband, but outside the audio filter's passband, can still "pump" the receiver AGC. Even though you can't hear the interfering signal, it will reduce receiver gain, which reduces the level of the signal you are trying to receive.

But the filters still are useful, especially for operators who are not experienced at employing their "biological filter" to receive signals in the presence of noise and interference. If you've got the money, they are worth it.

424. Company Emergency Plans?

Newsgroup: rec.radio.amateur.misc

From: eamurashie@mail.beckman.com
Message-ID: <eamurashie.34@mail.beckman.com>
Source record: 272197

Here at Beckman we just started a Ham Radio Club. We felt that one way
of getting more backing from the company is to have an emergency plan
for the club that can be added to the company's disater team's plan.
Has anyone written such a plan for their club at their company that they
might share with us? Or in general terms what does your club do for the
company in an emergency? Your help would greatly be appreciated. Thanks
in advance.

I am seeking net opinions re: the current crop of contest-style
memory keyers. I am very pleased with my present 6502-based
Kansas City Contest Keyer. I am considering getting another
keyer and was wondering if any of the newer ones are 'better'.
It must have at least 4 message memories, serial numbering, message
sending via remote buttons on the paddle, and a speed KNOB.
What should I be considering, MFJ, Logitek, ???
Your opinions appreciated.

Wayne Strahl - W9II wstrahl@cbnewsg.att.com

426. Engine Noise

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-19 20:50:08 UTC
From: ksmith@theodolite.ae.calpoly.edu
Message-ID: <1994Jan19.205008.14420@cs.yale.edu>
Source record: 272210

I recently did a tuneup on my 1990 Isuzu Trooper, and I'm noticing MAJOR engine noise in both my scanner and 2m/440 rig. I've determined that the problem is _NOT_ the spark plug wires, and this leaves only the spark plugs themselves, or perhaps the distributor cap.

I used Autolite Platinum plugs. Has anyone experienced noise problems with these? The problem is definately coming in via antenna leads or directly into the radios (ie: NOT the power cables), since I've been able to duplicate the problem when using the HT in the car.

Help!

Hi all! I'm looking for recommendations for 2m/440 dual band
base vertical gain antennas, such as the following:

Comet CA-2x4 series
Diamond X-500 and X-700 series
Cushcraft ARX-270 and AR-270 series (I hope I get a reply from Gary KE4ZV :-)

Naturally, comments, flames or smileys regarding these or any other
models are welcome. (these just seem to be common on the market)

I plan on mast mounting approx 25' above ground, and am looking
for durability and good design and construction, with inflated gain figures
as a secondary consideration.

Since this may be of interest to other hams, I'll summarize & post.

Would appreciate a cc: to ken@boxhill.com in case I miss a reply on the group.

73 and thanks!

Message-ID: <2hkcrc$hki@iris.mbvlab.wpafb.af.mil>
Source record: 272200

I've been using Microsoft WORKS for logging. It has Database, Spreadsheet, and Wordprocessor. The Wordprocessor easily prints labels with all the pertanent info needed for a QSL card. The Spreadsheet is nice to use for a checklist of countries/states worked.

The advantage of using a DB manager like this is that you can roll your own. If you want a report of all stations worked in 1990, or all contacts except US, or all 3Y contacts on all bands, these are easy to produce.

A side advantage is that you learn to do other things with your computer.

The difference is that the IC24AT was factory built and then adjusted
by the factory to specified tolerances. Selling a kit which is highly
sensitive to component tolerances without providing an adjustment
method is considerably different. I've been insisting that people
who attempt to build and operate VHF and UHF amateur gear really need
to verify the performance of the home-built (including kits) gear,
since VHF/UHF gear is generally more sensitive to component and
construction tolerances than HF gear. John Ramsey tries to sell
kits that a person can tune with a VOM; this is asking for trouble
if he doesn't go out of his way to engineer the kit to reduce the
influence of component and construction tolerances.

I thought you wrote him a letter and he responsed (?). I like to tinker,
too. I buy really good radios (like Micor, Custom MVP, etc.) and use them
as a platform for careful experimentation. For the $200 an FX-440 with
cabinet costs, you can buy a Micor, some rocks, the manual, and a handful
of PLL synth chips and go to town...

By the way, I've written an SGI Indigo interface for morse.c. I've sent it to the author for inclusion with morse.c, but if anyone wants it in the meantime...

(works only for SGIs with Audio Library - i.e. the ones with /usr/lib/libaudio.a not the ones that just let you write bits to /dev/audio. Indigos, 4D/30s and 4D/35s for sure, 4D/20s and 4D/25s for sure not. Don't know about any others, although machines more recent than the Indigo probably have it)

Anyone else improved on QSO.c? ("I am a airline pilot."?? Puh-leeeze!)

Well, after months of screwing around I've been given 2 day's notice to ship out to London.

Question is, are there any clubs in the area around the Hotel Busch (?) in Surrey? When do they meet? Can a licensed (U.K) foreigner use their club station (if they have one? Any hamfests (sorry rallies) in February? Any information will be appreciated.

BTW, I'll be at British Aerospace. Hopefully I can get on the Internet from there.

Thanks again,

Bill

437. Expanded receive mod for Yaesu FT-41R

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-20 00:27:47 UTC
From: ford@summit.novell.com
Message-ID: <2hkj63INNbge@alpha1.summit.novell.com>
Source record: 272205

I and a friend each just got a Yaesu FT-41R HT.

I called Yaesu and asked for any available mods. They have an expanded Rx/Tx mod which they won't give out without proof of MARS/CAP authorization. They did tell me about a keypad mod for getting just the expanded receive. You just hold down both the up and down arrow keys while powering the unit on.

Now it accepts frequencies from 420-470 MHz instead of its normal limits of 430-450. It still only transmits on 430-450. It also now requires the 100MHz digit to be entered when a frequency is directly entered. I don't know why this is since it doesn't seem to accept any frequencies that don't start with "4". Does anyone have any explanation for this?

Does anyone know of any other mods for the FT-41R? I heard that some Yaesu 70cm HTs can pick up the 800MHz range; can the FT-41R be modified to do this?

Thanks,

SYNOPSIS OF ACTIVITY

Solar activity was low. Region 7654 (N11E32) was
responsible for two C4/SF flares with associated weak radio
emissions. The region has shown some penumbral decay in the
north while generally maintaining its overall size and spot
number. Inversion line analysis indicates a beta-delta
magnetic configuration. Region 7652 (N06E18) has been very
stable this period.

Solar activity forecast: solar activity is forecast to be
low with C and possible M-class flaring expected from 7654.

STD: A moderate amount of shear continues to exist near the delta configuration in 7654. Shear may have weakened slightly over the last 24 hours. A Yohkoh xray image for 19 January (01:00 UTC) has been appended to this report showing the large area of x-rays emitted near Region 7654, as well as several coronal hole features.

At middle latitudes, the geomagnetic field has been at quiet to minor storm levels for the past 24 hours. At higher latitudes, levels ranged from unsettled to major storm. The storming is believed to be coronal hole related.

Geophysical activity forecast: the geomagnetic field is expected to be mostly unsettled to active for the first two days. Mostly active to some minor storming is expected for day three due to a new favorably positioned coronal hole.

Event probabilities 20 jan-22 jan

Class M 25/25/25
Class X 05/05/05
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 20 jan-22 jan

A. Middle Latitudes
Active 30/35/50
Minor Storm 20/25/35
Major-Severe Storm 01/05/10

B. High Latitudes
Active 35/40/55
Minor Storm 20/30/40
Major-Severe Storm 05/10/15

HF propagation conditions have changed very little over the last 24 hours. High and polar latitudes continued to see periods of moderate signal degradation due to sporadic bursts of geomagnetic and auroral activity. Some of these degradations were observed migrating into the upper middle latitude night-sectors. Conditions showed minor improvement near the end of the UTC day, although this will likely be short-lived. A well-placed coronal hole is now near the central solar meridian and is expected to sweep another disturbance past the Earth on about 22 January. This should result in poor to very poor propagation for high and polar latitude paths, and good to occasionally poor propagation for the middle latitudes. Low latitudes should continue to see near-normal propagation. The most heavily affected paths will be night-sector transpolar and transauroral circuits.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

447. Re: Seeking Opinions of Memory Keyers

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-20 07:06:54 UTC
From: markeh@netcom.com
Message-ID: <markeh-190194230654@markeh.slip.netcom.com>
Source record: 272142

I have a Logikey, an AEA MM3, and a MFJ (newer model with the "menu system"). I vote for the Logikey. Smoothest keying, most integrated operation. Most ability to embedd instructions in the memories (ie: programming the memory, in addition to saving code, that is). My only complaint is that it only has 4 memories. I would really want at least 8. However, I still think its the nicest overall.

Will run off of a 9v battery (although I havn't tested how long.

Mine had a problem - it generated RFI in the 17 meter band - in the CW subband (imagine that - a keyer generating CW RFI!!). I called W9KNI, and he suggested more shielding. Added several wires, slightly bent the audio cable I was using to key the radio (to improve shield contact), and the problem went away. My guess is that they all cause slight RFI, but most outside of the CW subband, or outside of the ham bands entirely. If this was the case, I never would have known of the problem, and it never would have bothered my.

Hope this helps

Russian Amateur Radio Emergency Service

(This information may be reproduced freely).

Russian Amateur Radio Emergency Services (RARES) was born during the turbulent days of the Chernobyl tragedy. But RARES true abilities emerged in December of 1988, at the time of Armenia's devastating earthquake. No communications were available with the disaster zone, with a notable exception of amateur radio. Our emergency network was fully operational two hours after. Rescue teams, as well as the Disaster Relief HQ in Moscow and Armenia, had their communications provided by RARES and the amateurs of the former Soviet Union. May 1991 - another earthquake in Georgia - and again RARES assisted the search and rescue teams. There are many similar examples, where RARES provided invaluable life-saving links, in situations totally lacking goverment communication support.
On August 19, 1991, the faithful day, when democratic movement in Russia was hanging by a thread, RARES station begun transmitting Boris Yeltsin's decrees to the peoples of Russia. And the following day, R3A became operational from Moscow's "White House", providing communications support for three days to the President of Russia, the members of the Parliament and the "Radio Russia", when the putschists took control of media and telephone facilities.
We, the RARES members, are ready, willing and able. We are ready to react immediately, in Russia or anywhere else (like during Iranian earthquake of 1989), where our help is needed. We are a thousand-strong with members all over Russia. Our sole purpose is to provide disaster relief communications. We do the job, but at present lack outside financial support and modern equipment. High on the list of our needs are mobile and portable equipment, generators, means of transportation and tents. We are in dire need of digital communications equipment. Any and all assistance would be welcome and attention to our needs would be greatly appreciated.

[DThe QRZ! CD contains source which should recompile on most UNIX systems + executables created on a Sparcstation running SunOS 4.1.3. You should be in good shape.

>I wish to use them for their callsign databases.
>Can I mount these CDROMs from SunOS/Solaris? (ISO9660?)

Yes.

>Is the callsign database contained therein usable without
> any of the x86 .EXEcutables that may be there?

Yes.

>Is the callsign database in a reasonably massageable format
> that a reasonable C program could grok?

Yes. All the information in the database is also in a simple comma-separated file.
>Which of the CDROMs out there would be most appropriate?

I'm really, really impressed with the QRZ! CD. I haven't seen the other you mention, but having seen the QRZ! CD, I see no reason to look further. Like everything else I've ever bought from Walnut Creek, this thing is super.

Look at the Windows program created by W5XD -- a demo version is
available on the CompuServe Ham Forum, and some other outlets.
You can also contact Wayne directly (he is good in the book, Round
Rock TX). I've run his demo on a notebook 386 quite nicely. Wayne
used his program in his section winning CW scores.

I have no financial interest; Wayne was VP of the Williamson County
(TX) ARC while I was Pres. (before moving to Atlanta). A friend,
a good programmer, and a genuinely nice amateur.

454. Heath SB-1400 problem

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-20 13:53:17 UTC
From: bennett@keylime.cis.ufl.edu
Message-ID: <2hm2cd$evg@snoopy.cis.ufl.edu>
Source record: 272149

I would appreciate some help with a small problem that just reared it's ugly
head. I have a Heath SB-1400 HF Transceiver(cousin of the Yaesu FT-747GX).
Over the weekend, receive sensitivity went blah. Ah ha! consult the schematics
and manuals time. While thumbing through the manuals I found reference to a
small light bulb installed on the receive side of the T/R relay that could
cause the problem if it were blown. I checked the bulb, and, sure enough,
it is blown. Well the manual gives the specifications for the bulb as any
8 volt, 100ma pilot lamp(wire pigtails to be precise). Out come the catalogs.
I have not yet been able to find a pilot lamp even coming close to those
specifications. Therefore I approach the net.wisdom in locating the part
number and manufacturer for the appropriate lamp. As this is my only HF
rig that is even remotely capable of meeting my fully legal and licensed
requirements, it is rather important to me to get the unit back up quickly.
If I can find a standard lamp part number, it will be comparatively easy.
(And I will definitely purchase spares this time!)
Any help or information the net can provide me with will be DEEPLY appreciated.
Thanks

Paul R. Bennett N4EGO (General class .. FINALLY)

ARLB008 League at NJ hearing

League at NJ hearing

At a public hearing on January 11, ARRL officials told the New Jersey Department of Environmental Protection and Energy that a state proposal to register and impose fees on rf sources was contrary to federal law as related to radio amateurs.

The New Jersey proposal, released last month, exempted Amateur Radio stations but left a door open for future regulation of amateurs.

ARRL General Counsel Chris Imlay, N3AKD, and Northern New Jersey Section Manager Rich Moseson, NW2L, both spoke at the hearing on behalf of the more than 5,000 ARRL members in New Jersey.

The League representatives argued that only the FCC had the power to license and regulate radio transmitters, and that applying the proposed regulations to amateurs would effectively preclude Amateur Radio communications in New Jersey.

A number of other ARRL officials and interested amateurs also were present at the hearing, and a specific exemption was requested for radio amateurs.

The NJ DEPE has extended the deadline for comments on the proposal until February 22. More information is in February QST.

ARLB009 Tower victory in court

Tower victory in court

A federal appeals court in Minnesota has found in favor of an amateur and against a local municipality, the latest round in a three-year battle.

Sylvia Pentel, N0MRW, applied in January 1991 for a zoning variance for a 68-foot crank-up tower from the city of Mendota Heights. At the time, she was using a roof-mounted vertical which, she was unaware, violated the city's zoning rules. The city denied her application for a tower but granted a special-use permit to allow her to keep the vertical.

Pentel sued the city in US district court, saying that its ordinance was preempted by federal law PRB-1, which recognizes the needs of both municipalities and amateurs, and which requires a ''reasonable accommodation'' of the needs of amateurs. The district court found in favor of the city, and Pentel appealed.

The US Court of Appeals for the 8th Circuit said that the FCC in PRB-1 ''was attempting to strike a balance'' between the interests of municipalities and amateurs, and exhorted the parties to the suit to work together to ''arrive at a satisfactory solution.''

The court of appeals said that its decision does not mean that the city must necessarily grant Pentel's application for a tower as it stands, but rather that the city must make a reasonable accommodation for her interests. The court said that granting a special-use permit for Pentel's vertical was not an accommodation.

Pentel's lawyer was John B. Bellows Jr, K0QBE, with assistance from ARRL General Counsel Christopher Imlay, N3AKD.

>we're talking the kind of money that could buy one or two xtal filters...
>this is apples and oranges, but just so I get a feel for their relative
>effectiveness, which offers more bang for the buck, do you think?

I have an FT-990. I also have the Timewave DSP-59. If you liked what the
SCAF filters in the 990 did, the DSP-59 will knock your socks off. On CW
it can can go down to 50Hz bandpass, all you hear is the tone with virtually
no ringing!! But it really shines on SSB with its 2 noise reduction and
heterodyne elimination algorithms. Try one some time, you'll be amazed!!
I have had the DSP-59 for about 8 months, and now I can't do without it!

73,
Mike

458. HP's vector modulator

It most likely means that whoever wrote it had no idea what he/she was talking about. Typical.

Could it be a special rate for cellular service? Don't some cellular providers offer low 'lifeline' rates for people who only use the cell phone for emergency calls? Cell phones are the only 'radios' I know of that are licensed thru the phone company. But then, maybe *I* don't know what I'm talking about.

The HP HPMX-200_ series of vector modulators (from HPs Communications Components Division) consist basically of two Gilbert cell mixers and a combiner to form an I-Q mixer system. This can be used to make a QPSK modulator or image reject mixer. Some of the chips have on board quadrature networks. The frequency range is over 2 GHz.

You can get data sheets and parts from distributors such as Hamilton Avnet, Penstock, Newark, and Arrow.

Sounds interesting. I just bought a Ten Tec Omni VI and within a week will have all the optional filters (inluding 1.8khz SSB filter, 500, 250 hz CW filters and the 500 hz narrow filter for the second IF).

Will the DSP help in this situation or would it be overkill?

Steve

Brian,

Are there any numbers on the cable? Without the numbers I can't be sure,
but here is a guess, from the Belden catalog:

89880 Ethernet Cable

Description: Plenum version of 9880 trunk cable; Orange tint FEB Teflon
jacket, cellular FEP insulation, ring-band stripes marked every 2.5 meters
to aid users in tap placement.

Construction: Aluminum Polyester +
95% tinned copper braid +
Duofoil +
95% tinned copper braid

Diameter: .375 inches
Impedance: 50 ohms
Velocity factor: 78%
Capacitance: 26 pF/ft
Loss: .19 db/100ft at 1 MHz
.37 db/100ft at 5 MHz
.52 db/100ft at 10 MHz
1.20 db/100ft at 50 MHz

For CW only, my guess is that the DSP is not worth it. I have a Kenwood
850 with cascaded 500Hz filters or combination of 500Hz and 270Hz. The
W9GR DSP unit (I expect the DSP-59 to be similar) offers no particular
advantage.

* Disclaimer: I do not operate SSB, so get the salt shaker ready.*
About SSB - the Omni Vi comes with the multi-heterodyne notcher
and so the only value will be from the white noise reducer. All of the
DSP units that I have heard distort the audio when in this mode. Further
they only work well when the SNR is high. In that case, you may as well
use the rf gain pot - cheap and effective. I discovered this in attempting
to get a clear broadcast station reception.

The only mode for which I have found the DSP filter to be of value
is RTTY. This, I suspect, is because the filtering in Kam-All-mode
is a bit too all-mode --- compromised, that is. :)

Sorry for raining on the DSP parade.

I think the next generation of products with
- the kind of processing described in QEX for CW (nice artice Jon)
- may be, harmonic alignment and interface with rig for automatic tuning/lock
on SSB (see the disclaimer above)
- smarter rtty demodulators that exploit the mark/space partial redundancy

better
might really begin to exploit the promise of DSP for ham radio communication.

Source record: 272162

Hi all FRG-9600/FRG-965 users,

I have available a CAT controller program for the YAESU FRG-9600 which multitasks in the background and does everything the FRG-9600 can do to the max. Brings to the radio, all the features you would see in a modern scanner. Also includes a very simple and cheap CAT interface which is better but compatible with the FIF-232-C from YAESU. It has enhanced features as well. E-mail me for it.

Redesign those FX series radios with TIGHTER front-ends -- forget
wide-coverage -- make 'em tight for the ham bands for improved receiver
performance. Also, LOWER the price -- how about including the case kit
for free?

The kits have been improved over the last few years, but $150 for a
radio with no case, no mic, no speaker, no PL tone board is TOO
EXPENSIVE.

Are they really that expensive? With automation, labor is no longer as large a fraction in the price of electronics nowadays. Thus, you can't expect to compare built prices with kit prices. In addition, most hams are now appliance operators and there is very little in the way of economy of scale. The volume is low and the costs high. Is it any small wonder that kits are expensive?

In the specific case of the LA earthquake, both local telephone companies
(General Telephone and Pacific Telephone) recommended that people calling
to talk to someone in the affected areas instead call someone else
in LA who isn't in one of the areas, and having them place a *local*
call instead. This was issued sometime late Tuesday -- or at least,
the news media reported this. However, in most cases, Al is correct.

>than the ridiculous fixed-frequency handheld and my Sony Walkman!

>(Now if only I could work out a way to put an external antenna on that
>Walkman so I can get better reception from narrowcast FM stations!)....

Id go to the ocupational health and safety officer and present a case
that useing these hand-helds in the cab next to ones head is a potential
health risk, and that roof mounted attenna's should be fitted to all
locomotives, and not just the select few that run interstate.
Then you reduce the close emmissions to the times your are outside checking
things.
Not the best, but at least you have removed the situation where you are
in a metal box, holding the annenna next to your head, with the RF bounceing
around untill it finds a window..

Craigs problem is based in the fact that the current NSW railway radio
system is a 10 year old 'tempory measure' that officals keep saying will
be replaced RSN. (Ie they wont spend money putting desk mount units in,
'cause they will 'be replaced soon anyway')

Ok, I've gone though the 200 or so unexpired articles, as well as
the FAQ (probably not closely enough) and below is the
closest my question has come to being answered.

In article <2hebl3$2l9@news.acns.nwu.edu> rdewan@casbah.acns.nwu.edu (Rajiv Dewan) writes:
>In article <CJqtFz.61@wri.com>, Bruce Pea <pea@wri.com> wrote:
>>Can anyone recommend some good books on copying code??
>>
>>Next test date is in March here, and I want to be ready
>>to "ace" the 13wpm general class code test. I'm using
>>SuperMorse and listening to code on my radio. I remember
>
>Noting the lack of a call sign in you sig, I assume that you
>are not a ham yet. So I will not recommend getting on the air
>and using it. ... [delete] ...

My question is:

If I pass the 13 wpm test, do I also have to pass the 5 wpm
test? Or in other words; Can I get a General class license
by passing the written tests for Novice, Technician and
General and then pass ONLY the General CW test?

I am interested in a General class license because of the
privileges it provides but I am not that hot about learning
CW at 5 wpm, then having to bump up to 13 wpm. I've listened
to 5 and 13 wpm and they sound like two different languages!

I'm pretty confident that I can be proficient at 13-15 wpm with
plenty of practice. Any thoughts on how 'practical' this ambition is?
Am I setting myself up for 'too much' work by skipping over the
5 wpm rate?

483. Online Repeater Directory

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-20 22:49:54 UTC
From: yee@mipgsun.mipg.upenn.edu
Message-ID: <2hn1qi$m2p@netnews.upenn.edu>
Source record: 272175
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

```
# This version 0.02 (last updated 19940120) of an online repeater
# directory which currently contains over 1800 entries. All previous
# versions are obsolete.
#
# Thanks go to Errol Casey (KD4IHW) and Bryan Peterson (N0ORR ?) for
# their contributions.
#
# There are entries for AK, CT, DC, DE, HI, ID, KY, ME, MT, NC, ND, NH,
# NJ, NV, NY, PA, RI, SD, UT, VT, WV, WY. Since the last time this data
# base was posted, I have added one state and two volunteers have added
# four more.
#
# Is this project serious? Yes. As a gesture of good faith, I have not
# concentrated solely on regions of the country where I live and work
# for the states I have already completed. As you can readily tell, I
# 22 states have already been completed. Any effort that a volunteer
# might make is not likely to be wasted. Unfortunately, I do not have
# the time or the energy for all 50 states. If you guys are actually
# interested in an online repeater directory, put up or shut up.
#
# Thus far, people have volunteered for
# 1) AZ
# 2) KY, MS, SC, TN, VI, WV, GA (two states already done
# but the current data will be replaced with up to date
# information).
# If everybody follows through with their intentions, we will soon have
# over half the United States accounted for.
#
# I have checked with Project Gutenberg and using the data from the ARRL
# repeater directory or any other published sources is legal. It is
# only the format which is copyrighted. My intention is to post it to
# USENET and to have Project Gutenberg be one place to distribute it.
#
# This file with all the data is be available for anonymous ftp as
# mipg.upenn.edu:/pub/yee/rptr002.Z
#
# Assistance in other states would be appreciated. I would be
# interested in volunteer assistance in completing this database.
# Volunteers should be willing to take up an entire state. Partial
# state listings do me absolutely no good as I will have to go over
# everything by hand to see what is missing. If all those people who
# are interested in getting an online directory together would be
# willing to volunteer for one or two states each, then this directory
```

```
# will be completed in short order.
#
# If there are file format revisions after 0.3, I will worry about the
# file format conversion but I don't expect that there will be any need
# as all or nearly all important fields have already been defined and
# (hopefully) plenty of room has been left for expansion of the field
# definitions.
#
# At first, this directory will contain only 2 meter entries. After all
# 50 states have been completed, updates will then be accepted. If
# someone else is interested in tackling other bands, it would be most
# appreciated. [The current release contains entries for other bands for
# NC.] The proposed file format should be flexible enough for all bands
# and all modes for which a repeater directory would be useful.
#
# I make absolutely no claims as to the accuracy of ANYTHING!! There
# are undoubtedly numerous errors all over the place. Some are
# typographical errors on my part (the data has been typed in by hand).
# Other errors are due to outdated information. Little or no attempt
# has been made thus far to check the data at all as I consider it more
# important to finish the database itself. In general, corrections to
# the database will not be applied until this is done.
#
# Conway Yee, N2JWQ
# yee@mipg.upenn.edu
#
# ============================================================================
#
# The file format (version 0.3) shall be as follows. Consider this file
# format to be in the alpha stage and subject to frequent and arbitrary
# revisions. Each entry will be delineated by being on a different
# line. Each field of a repeater entry shall be delineated by colons.
# The text within a field shall not contain a colon. The field
# definitions are as follows:
#
# 0 latitude (deg,min,sec)
# Each component of the field shall be delineated by commas.
# 1 longitude (deg,min,sec)
# Each component of the field shall be delineated by commas.
# 2 elevation (meters)
# The metric system has been chosen for this field fo the
# eventuality that this database is expanded internationally.
# Unfortunately, in backward countries such as the US, the
# English system is still dominant.
# 3 height above average terrain (meters)
# The metric system has been chosen for this field fo the
# eventuality that this database is expanded internationally.
# Unfortunately, in backward countries such as the US, the
# English system is still dominant.
# 4 spare location designation if grid squares are used for some
```

```
# repeaters while others have the above.
# 5-7 reserved for future use (e.g. ERP)
# 8 continent
# 9 country
# 10 major region designation (e.g. state, province)
# Use standard abbreviations if possible (e.g. NY, CA).
# 11 minor region designation (e.g. county, nearest major city)
# 12 immediate location (e.g. town, city, mountain)
# 13 output frequency of the repeater (MHz)
# 14 input frequency of the repeater (MHz or standard offset: + or -)
# The use of +,- may have to be deleted in the future if this
# repeater directory is extended to other countries that have
# differing standard offsets.
# 15 repeater call sign
# 16 misc. notes (for anything not covered in other fields)
# My intention is to standardize this at some later time.
# SERA Database Key: ARRL Database Key:
# N non-Member SERA o open
# A Open Autopatch c closed
# B Emergency Power t CTSS tone access
# C Under construction tt Touch Tone
# E Emergency Autopatch RB Remote Base
# K Packet Operation a autopatch
# L Linked Repeater e emergency power
# O Off the Air Temporarily x wide coverage
# P Private Autopatch wx weather net
# R Remote Base System y rtty/ascii
# T Tone Accessed z direct access to law enforcement
# V Television (SSTV/ATV) l linked/crossband repeat
# Y RTTY Operation
# 17 sponsor (call sign or club name)
# 18 source of entry (call sign preferred)
# If entry is copied from a published source and not personally
# verified, use the organization publishing the data (e.g. ARRL)
# key : sera - South Eastern Repeater Association repeater index
# arrl - American Radio Relay League repeater directory
# rtari - Research Triangle Amateur Radio Info (v2.18) 1/10/94
# 19 date entry last updated (YYYYMMDD)
# Since published data may only have a year of publication, the date
# shall have a month and date of 0000 (e.g. 19940000).
# 20 PL access (Hertz)
# If multiple for multiple inputs, delineate with commas.
# If none, enter 0.0
# 21 mode (e.g. F3E, A1A)
# 22-27 reserved for future use (e.g. trustee)
#
# Any subsequent fields are free for users to define for their own use.

Cross-posted to: rec.radio.amateur.misc,uk.radio.amateur

Good morning. It's Sunday the 23rd of January and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

We start this week with the news that Ian Suart, GM4AUP was formally installed as the President of the Radio Society of Great Britain for 1994 during the evening of Saturday the 15th in Glasgow. We are sure that all those listening will join us in wishing Ian a successful year as President during 1994. In attendance were representatives of the French, Belgian, Dutch and German national societies. In his address, Ian spoke of plans to hold more regional meetings where members can meet and question officials of the RSGB. The text of his speech appears in February's edition of Radio Communication which is due to be posted to all members later this week.

Now, attention all Novice instructors who intend to enter candidates for the March Novice Radio Amateur Examination. The November 1993 edition of the Novice Instructors' Newsletter gave an incorrect date for the examination. The correct day is Monday the 14th of March. Instructors are reminded that the closing date for entries to be received by the City & Guilds Head Office is Tuesday the 1st of February.

There are vacancies for Morse Test Examiners in the county of Buckinghamshire. Radiocommunications Agency requirements stipulate that prospective examiners must demonstrate their ability to receive at 20 wpm and send a typical test passage on a manual key at 12 wpm. In addition, the Society are looking for people with ability to deal with candidates in a professional and helpful manner. Applicants should write to the RSGB Chief Morse Examiner, Roy Clayton, G4SSH, at 9 Green Island, Irton, Scarborough, North Yorkshire YO12 4RN or telephone him on 0723 862924. Interviews will be conducted at the RSGB London Amateur Radio Show.

The Guides Thinking Day on the Air will take place during Saturday the 19th and Sunday the 20th of February. A list of participating British GB Stations and of Countries permitting Third Party Greetings Messages is available from RSGB Headquarters on receipt of a Self Addressed Stamped Envelope, size A5 or larger, please mark the envelope TDOTA 1994 List.

The 70cm Repeater GB3BA has now been rebuilt and the Grampian Repeater Group intends to put the system back into service next Sunday the 30th of January at 1500 UTC. The repeater transmits on 433.025MHz (channel RB1) and is located 16km WNW of Stonehaven, near Aberdeen. Further details and/or reports should go to the Repeater Keeper GM3VEY, QTHR.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Canada, VO1XA will sign VO1XA/VE8 from now until June during his tour of duty in NW Territories. From British

Virgin Islands, W2GUP will sign VP2V/W2GUP from today, Sunday the 23rd, until Thursday the 17th of March. From Cayman Islands, W8BLA and K2UFT will sign ZF1CQ from Tuesday the 25th until Monday the 31st of January. Operation will be CW only, taking in the CQWW 160m CW Contest, but before the contest look for them on the WARC bands. And from Ogasawara, JA1LSY will be active as JA1LSY/JD1 on SSTV only on 14MHz band, from Saturday the 29th until Tuesday the 8th of February. This is the first SSTV operation from Ogasawara.

Rally news now and we have one event this week:

The Oldham Amateur Radio Club Radio Rally which is being held at the Queen Elizabeth Hall, Civic Centre, West Street, Oldham, Lancs. Doors open at 11.00am, or 10.30 for disabled visitors. The event features many trade stands and a bring and buy stall. Refreshments will be available and talk-in is on channel S22 via GB4ORC, starting at 7.30am.

We know of only one rally for next Sunday the 30th of January:

The fourth Lancastrian Rally which is to be held at the University of Lancaster. Doors open at 11.00am, or 10.30 for disabled visitors. The rally features many trade stands and a bring and buy stall. Further details can be obtained from G1OHH on 0524 64239.

Next a date for your diary.

The 1994 RSGB VHF Convention is to be held at its usual venue at Sandown Race Course, Esher, Surrey on Sunday the 20th of February. See January's RadCom, page 24, for full details of the comprehensive lecture programme.

HF contest news now:

The RSGB LF Cumulative 3.5MHz Contest takes place today Sunday the 23rd and again next Saturday the 29th. Both run from 1600 to 1800 UTC. The RSGB LF Cumulative 1.8MHz Contest is next Thursday the 27th of January from 2000 - 2200UTC. The next RSGB LF Cumulative 7.0MHz Contest takes place on Sunday the 30th from 1000 - 1200 UTC. December's RadCom, page 84, gives detailed information on all of these LF Cumulative Contests. The ARRL CQ Worldwide 160m Contest takes place next weekend, starting at 2200 UTC on Friday the 28th and finishing at 1600 UTC on Sunday the 30th of January.

Next some VHF contest news:

The first of five events in the RSGB 70MHz Cumulatives Contest is today, Sunday the 23rd, with the second on Sunday the 30th from 1000 to 1200 UTC. There are three sections:- Fixed station single operator, Open and Listeners. The RSGB 432MHz Fixed, AFS and Listeners Contest takes place on Sunday the 6th of February from 0900 to 1500 UTC. There are three sections:- Single operator fixed, Multiple operator fixed and Listeners. See December's RadCom page 83 for details for both of these VHF events.

Special event stations this week include:

GB4FFL (Fight For Life) operated by members of the Salop Amateur Radio Society in support of the Air Ambulance appeal from a site near the old Control Tower

at Condor Airfield, Shropshire. The station will be on the air during Saturday the 29th and Sunday the 30th from 9am to 6pm. All are welcome to visit the station. Contact Sheila, G0SST on 0743 361935 if you require further details. During next weekend many other Special Event Stations will be taking part in the Midlands Air Ambulance appeal. See January RadCom for a list of callsigns.

And now the solar factual data:

The period from the 10th to the 16th of January has seen a coronal mass ejection, some M flares and a lot of magnetic disturbance, particularly at high latitudes. The sunspot index has declined from the recent high levels and meaned about the 84s. An M6.1/1N flare was reported on the 16th. Solar flux levels did not vary much over the period and averaged 98 units. The geomagnetic activity was influenced by a coronal mass ejection on the 12th. Though only lasting 30 minutes, it pushed up the geomagnetic activity from a quiet Ap of only 1 on the 10th to sub storm levels of 32 on the 12th. The levels remained very unsettled for the rest of the period with the Ap indices averaging 23 units. The state has been magnetically active at high latitudes for most of the period. The daily averages of the aa indices, as supplied by the British Geological Survey, for the 4th to the 10th of January have been quiet. The average was only 11.5 nanoTeslas, with the 9th being down to only 5.8 nanoTeslas. There were periods of only 2 nanoTeslas. The X-Ray flux has generally declined over the past three weeks from the very high levels of B8.1 units, and is now down to what is more like the levels we would expect. The average for the period was B2.6 units, though levels seemed to be climbing again with the 16th being up to B3.8 units. Bartells rotation 2192 starts on January 26. The mean 90 day solar flux is 102 units.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers as reported by Meudon averaged 8.1MHz. The darkness hour lows averaged 2.3MHz. These have been severely affected by spread-F lasting up to 8 hours on some days, together with blanketing E, but that only lasted for an hour or so.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg have been affected by the high latitude magnetic storms and averaged 6.4MHz. The darkness hour lows averaged 2.1MHz. As the closure of Darmstadt means the radio quality indices are no longer available and no UK ionospheric data is available either, it will be increasingly difficult to know what state the ionosphere is in. As a result of this, the forecasts over the next few weeks will be varied to try different ways of expressing what we think is likely to happen.

And lastly the solar forecast:

This week, the active side of the sun will be coming into view. Solar flux levels are expected to be about the 110s, and the magnetic activity is expected to be mainly quiet. Ionospheric MUFs at equal latitudes during daylight in the south are expected to be about 24MHz and for the darkness hours about 9MHz.

And that's the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 U J and G7 R O series, and Novice calls in the 2 0 A H and 2 1 C M series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Next, the local news.

NEWS FOR THE SOUTH EAST

Meetings for Tuesday the 25th of January:

Dorking and District Radio Society meets for its Annual General Meeting at the Friends' Meeting House, starting at 7.30pm sharp. Further details from John, tel: 0306 631236.

GB3HZ Repeater Group meets for its Annual General Meeting at Chiltern Communications, Lincoln Road, High Wycombe at 7.30pm. For further details contact Alan, G4LWA on 0494 531755 or G4DDM on 0494 815355.

Home Counties ATV Group meets for its Annual General Meeting, to be followed by the 'grand' Junk Sale. Further enquiries to tel: 081 979 4432.

Stevenage and District Amateur Radio Society has a Video evening, showing "Big Beams, Big Station to Win Contests, Texas Style". Contact Neil, 2E1ASZ on 0438 350882 for details.

Thames Valley Packet Radio Group has a presentation 'G6BIF packet Soft Ware and BBS bulletin statistics' by Alan, G1AOL. Contact Graham, G8DMR on 0256 59773 eve.

Waterside Amateur Radio Society has its Annual Junk and Bring & Buy Sale at 7.30pm. Contact George, G0IDN on 0703 843491 for details.

Meetings for Wednesday the 26th of January:

Chesham and District Amateur Radio Society meets for "Hancock's Half-Hour" Further details from Ian, G0RTF on 0494 676391.

Cheshunt and District Amateur Radio Club has a Quiz Night with Alvin, G1VXD. Details from Roger, G4OAA on 0992 464795.

Dover Radio Club has a talk entitled 'Tales from the Repair Department' by G1HHU. For further details telephone 0304 825030.

Newbury and District Amateur Radio Society has a talk on 'VHF and UHF DX-ing' by Ian, G3SEK. Visitors are most welcome to attend. For further details from Norman, G0HFU tel: 0635 863310.

Meetings for Thursday the 27th of January:

Crowborough and District Amateur Radio Society meets for its Annual General Meeting at the Plough & Horses, Crowborough at 8pm. Details Mick, G6UUO on 0892 661807.

Reading and District Amateur Radio Club has a talk on 'The 1992 Mellish Reef DXpedition' by John, G3WGV. Further information from Vin, G4JTR on 0734 476873.

Shefford and District Amateur Radio Society has a talk entitled 'Charter Lea Motorcycles' Contact Paul, G1GSN on 0462 700618 for further details.

Southgate Amateur Radio Club has a Planning Session concerning the London Amateur Radio & Computer Show. For further information contact Brian, G0MEE on 081 360 2453.

Meetings for Friday the 28th of January:

Clifton Amateur Radio Society has a talk on 'How to Tune up Linears'. For further details contact Keith, G4TJE on 081 859 7630.

Hilderstone Amateur Radio Society has a talk entitled 'Extras for a Two Metre Station' by Paul, G3DNR. For further details telephone 0843 869812.

Itchen Valley Amateur Radio Club has a talk on 'What Packet can do for you and the DX Cluster System' by Chris, G4HCL. Further details from Les, G3ABA 0703 732997.

Maidstone YMCA Amateur Radio Society is showing a Video entitled 'American Holiday' by Nick, G4ZXI and a Morse training evening. Contact G0RHO, QTHR for further details.

Wimbledon and District Amateur Radio Society has a talk on 'Backyard Antennas'. For information contact George, G3DWW, tel: 081 540 2180.

NEWS FOR SOUTH WEST

Meeting for Monday the 24th of January:

Wincanton Amateur Radio Club has an Open Evening. Further details from Dave, G3ZXX on 0963 34360 or Andy, G1FPW on 0747 51381.

Meeting for Wednesday the 26th of January:

South Bristol Amateur Radio Club has a Computer Shareware evening. For more information tel: 0275 834282.

Meeting for Friday the 28th of January:

Shirehampton Amateur Radio Club has a talk entitled 'Acorn Packet Radio Card' by G0CJG. For further information contact Ron, G4GTD on 0272 770504.

NEWS FOR EAST ANGLIA

Meeting for Wednesday the 26th of January:

Ipswich Radio Club is hosting a Morse tuition evening at the Rose & Crown. Contact Sheila, G8HYE, tel: 0473 742072 for further details.

Meeting for Thursday the 27th of January:

Yarmouth Radio Club has a talk entitled 'Mechanical TV, part 2' by G3OEP. Contact Tony, G3NHU, on 0493 721173 for further details.

Meeting for Friday the 28th of January:

Cambridge and District Amateur Radio Club has a talk on 'Introduction to PC Net-working' by Tony, G0OEG. Non members always welcome. Contact John, G0TIL on 0763 243570 for details.

NEWS FOR THE MIDLANDS

Meeting for Monday the 24th of January:

Stratford upon Avon and District Radio Society has a talk entitled "European Space Agency" by Tony, G3ESK. For further details contact Alan, G0CXJ, tel: 0608 682495.

Meetings for Tuesday the 25th of January:

Buxton Radio Amateurs has a Video night. For details contact Derek, G4IHO, tel: 0298 25506.

Loughborough and District Amateur Radio Club has a 'Domestic Scene' Video session. For further details contact Ian, G8SNF by telephoning 0509 218259.

Meetings for Wednesday 26th of January:

Bromsgrove Amateur Radio Society has a talk on 'CQTV and Use of Oscilloscopes' by Mike, G6IQM. Details from Barry, G0TPG on 0527 542266.

Derby and District Amateur Radio Society has a Video show. Contact Hayley, G7PXA on 0773 856904 for further information.

Telford and District Amateur Radio Society meets for GB0AA preparations by 2E1BEW. For further details contact Dave, G4EIX, on 0952 588878.

Meetings for Thursday the 27th of January:

Amateur Radio Club of Nottingham has a Construction night. Contact Simon, G0IEG on 0602 501733 for further details.

Salop Amateur Radio Society has a talk on 'The Airfields of Shropshire' by Flight Lieutenant Ian Pride at 8pm. Details from G0SST on 0743 361935.

Meeting for Friday the 28th of January:

South Notts Amateur Radio Club has a Construction evening. For further details contact Julie, G0SOU on 0602 216342.

NEWS FOR THE NORTH OF ENGLAND

Meetings for Monday the 24th of January:

RATEC has a video show entitled 'Pitcairn Island'. The club meets at the United Reformed Church, Swann Lane, Cheadle Hulme at 8.15pm. Visitors are welcome. For details contact Don, G4SFU on 061-485 3912.

Meetings for Tuesday the 25th of January:

Bury Radio Society has a RSGB Video evening. For further details contact Mike, G4GSY on 061 761 5083.

Liverpool and District Amateur Radio Society has a Surplus Sale. Further details from Ian, G4WWX who is QTHR.

North Wakefield Radio Club has a Visit to the Police Air Support Unit. Contact John, G4RCG on 0924 362144 for further details.

Wakefield and District Radio Society meets for a Construction Evening. Further details from Roy, G0TBY on 0924 893321.

Meetings for Wednesday the 26th of January:

Mid-Cheshire Amateur Radio Society has a Rally Planning night. Details from Mike, G7LQD on 0606 331210.

Stockport Radio Society has a talk on 'De-commissioning' by John Hill-Wilson of Nuclear Electric. For further details telephone 061 439 4952.

Wirral and District Amateur Radio Club has a Surplus Equipment and Junk Sale. Contact Paul, G0JZP, on 051 648 5892 for further details.

Meetings for Thursday the 27th of January:

Eden Valley Radio Society has a Demonstration of Packet Radio, a Construction evening also a Bring & Buy sale. Further details from John, G0NYQ on 07683 52106. Keighley Amateur Radio Society meets for its Annual General Meeting. For further details contact Kathy, G0RLO on 0274 496222.

Hambleton Amateur Radio Society meets for its AGM at Allertonshire School, Northallerton at 7.30pm. Details from Nigel, G0NHM on 0609 776608.

Meetings for Friday the 28th of January:

North Ferriby United Amateur Radio Society has an 'Aerial Forum' by Frank, G3YCC. Further details from Frank, G3YCC, tel: 0482 650410.

South Manchester Radio Club has its Winter Direction Finding evening. For further details contact Edward, G7FQY, tel: 061 969 1964.

Stockport Radio Society Computer Group has a talk entitled 'Atari and Macintosh Computers' by G0HAL. For details telephone 061 439 4952.

NEWS FOR SCOTLAND

Meeting for Tuesday the 25th of January:

Dundee Amateur Radio Club has a Construction night. Details from GM4FSB who is QTHR.

Meeting for Thursday the 27th of January:

Dunfermline Radio Society has a talk on 'DK0WCY Propagation Beacon - an Ordeal by Listening' by Wallace, GM0GNT.

Meetings for Friday the 28th of January:

Ayr Amateur Radio Group has a talk entitled 'Broadcast Audio' by Tom, GM4YMA. Details from Ian, GM3VMG 0292 260870.

West of Scotland Amateur Radio Society has a talk on 'Standby Power for Comms Systems' by GM7AOW. Details from GM4COX on 0698 350926.

And that's the end of this week's GB2RS news broadcast, which was prepared by the Radio Society of Great Britain.

485. Re: Sony 2001 mods?

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-20 23:26:40 UTC
From: Ed Ellers <EDELLERS@delphi.com>
Message-ID: <940120.66400.EDELLERS@delphi.com>
Source record: 272177

Tom Jenkins <tjenkins@pnet16.cts.com> writes:

>Over the past few weeks, I've listened to my newly aquired 2010. Super radio.
> Are there any mods/installations that I should be aware of?

Actually, the ICF-2010 is fully unlocked and has all modes and coverage that the series is capable of. Some versions sold in other countries have certain features (285-531 kHz coverage, 26100-29999 kHz coverage, CW and SSB, air band , 76-87.5 MHz FM and/or external antenna inputs) disabled to comply with the regulations of those countries, but all such sets carry the model number ICF-2001D; the ICF-2010 is the US/Canada version.

-- Ed Ellers, KD4AWQ (happy ICF-2010 owner)

486. ANNOUNCEMENT: DSPMORSE.ZIP source is available via ftp

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-20 23:37:47 UTC
From: troc@inca.gate.net
Message-ID: <2hn4kb$13ah@inca.gate.net>
Source record: 272228

```
There is now a file at ftp.funet.fi called /pub/ham/morse/dspmorse.zip
It contains the source for the modified FFTMORSE executable I posted
several days ago. It is provided as it is, without documentation or
warranty.

487. Kantronics and VIC-20

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-20 23:43:11 UTC
From: k1zat@bah.COM
Message-ID: <Pine.3.05.9401201811.B3252-9100000@booz.bah.com>
Source record: 272229

I have both the VIC-20 Hamtext Operator's Manual (30 pages long)
and the Kantronics Interface Instruction Manual (20 pages). You
want me to make and send you copies or just extract some information?

I assume your looking for things like control-E (Return to Receive),
control-I (CW-ID), control 0-9 (message ports) sort of information?

jd....k1zat

488. Freebies from ARRL HQ

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-21 00:07:22 UTC
From: arrl@BIX.com
Message-ID: <arrl.759110842@BIX.com>
Source record: 272231

A reminder to all that the American Radio Relay League
continues to make available to Amateur Radio Operators and
non-amateurs alike a wide variety of free materials and
services. Of particular interest to the not-yet-licensed
individual would be the ARRL Prospective Ham Package. In
the PHP, one would find:
.-
1. Printouts of Volunteer Examination session
opportunities in his/her area.
.-
2. Listings of Amateur Radio clubs in his location.
.-
3. Helpful promotional material about the Amateur Radio
Service.
.-
Please remember that the above package is ONLY available
to not-yet-licensed individuals.

The already-licensed person might well be interested
in another free ARRL publication, the ARRL Public Service
Communications Manual. The PSCM represents the "bible" of
public service communications, and clearly/concisely
points out how the ARRL National Traffic System and the
ARRL Amateur Radio Emergency Service function as a
cohesive unit to provide the maximum support to the public
both in times of disaster as well as "normal" times.
.-
To obtain either of these free ARRL services, please
provide us with:
B. Your mailing address
C. A Specific request for either of the two services
above.
.-
73!
.-

489. RECIPOP packages

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-21 00:10:25 UTC
From: arrl@BIX.com
Message-ID: <arrl.759111025@BIX.com>
Source record: 272232

Yet another of the many free services that ARRL HQ offers
is the ability to obtain Reciprocol Operating permit
information.

Matter of fact, ARRL HQ is the ONLY place on the planet
where this information resides!

"Awrite, already" sez you, "why would I ever want one, and
how much are ya gonna burn me to GET one?" "Glad you
asked!" sez I

Radio amateurs are a constantly-travelling, very mobile,
bunch of folks, it appears, and their travels clearly take
them to countries near and far. Myself, I prefer "far"
rather than 'near', but if you're inclined to travel to
Canada, you can ignore this whole tome, as the Canadian
government and our own here in the States have worked out
an automatic-reciprocity agreement.

But if Belize is on your itinerary perhaps, or any of the
other many countries with whom we share a reciprocol
operating agreement, you're in luck! Many foreign
administrations DO allow U.S. Amateur Radio licensees to
apply for a reciprocol operating permit, and you need
but ask us for the complimentary package that we make
available.

To make your trip more enjoyable in that regard, we need:

1. Your name
2. Your mailing address
3. A specific request for the RECIPOP package for the
specific country you'll be off to.

And, yes, an e-mail request is fine!

493. How to find the answers to frequently-asked questions about Ham Radio

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-21 02:44:05 UTC
From: ikluft@kluft.com
Message-ID: <ham-faq-ptr-1-759120242@kluft.com>
Source record: 272120
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

```
Posted-By: auto-faq 3.1.1.4
Archive-name: ham-faq-ptr

How to find the Rec.radio.amateur.misc Frequently Asked Questions list
------------------------------------------------------------------------

This article will tell you how to find the answers to frequently-asked
Questions (FAQ) from rec.radio.amateur.misc. The FAQ articles are posted on
the 7th of each month. This article is posted on the 14th, 21st, and 28th of
every month as a reminder of where to find the FAQ.

The FAQ articles are intended to summarize some common questions on the
rec.radio.amateur.misc newsgroup and Info-Hams mail list as well as to help
beginners get started.

Besides the monthly posting, the FAQ is always available via anonymous FTP
and from e-mail servers. This article contains instructions for obtaining a
copy of the FAQ. It also contains the table of contents from the FAQ so
that you know which questions are covered by it.

Please provide a copy of the FAQ to any new or soon-to-be Hams you know.

Regular FAQ postings can help save network bandwidth and maintain a good
signal-to-noise ratio in the newsgroup. However, they can't do it alone - you,
the reader, have to use them. If you are a new user, please print and review
the FAQ articles and look at the instructions in the news.newusers newsgroup
before posting any articles. If you are an experienced user, please help by
refraining from answering frequently-asked questions on the newsgroup if they
are already answered by the FAQ articles. Instead, send e-mail to the user who
asked the question. (It will be helpful if you include the part of the FAQ
that answers their question, but not the whole thing.)

--How to obtain a current copy of the FAQ-----------------------------------

There are 7 ways to obtain a copy of the FAQ.
1) NetNews
2) Anonymous FTP
3) An Electronic Mail Server
4) Mail List Subscription
5) Gopher
6) Wide Area Information Server (WAIS)
7) World-Wide Web (WWW)

Option #1: NetNews
------------------
If you are familiar enough with NetNews to look through previous articles on
```

your system, Option #1 above may be the easiest for you. The FAQ is posted so that it should not expire from your site's news spool until the next one is posted. Unfortunately, some news administrators do not honor the expiration dates meant to preserve the FAQ.

Look in rec.radio.amateur.misc, rec.radio.info, rec.answers, or news.answers. If the FAQ has expired at your site, try Option #2 (and ask your news administrator to honor expiration dates for articles cross-posted to news.answers if he/she can.)

Option #2: Anonymous FTP

Anonymous FTP uses the File Transfer Protocol. It is only available to sites which are directly connected to the Internet. If you don't know how to use FTP and can't find a friend to help you, continue to Option #3. If your site is not connected to the Internet, you should also continue to Option #3.

The following sites have copies of the FAQ:
site name & address path to FAQ articles
------------------- --------------------
ftp.amdahl.com pub/radio/amateur/faq.[1-3].Z
located in western USA, FAQ updated daily
ftp.cs.buffalo.edu pub/ham-radio/faq_ham_[1-3]
located in eastern USA, FAQ updated monthly
rtfm.mit.edu pub/usenet/news.answers/radio/ham-radio/faq/part*
located in eastern USA, FAQ updated monthly
contains news.answers archive - most UseNet FAQs are here
grivel.une.edu.au pub/ham-radio/buffalo/ham-radio/faq_ham_[1-3]
located in Australia, FAQ updated monthly
(Ham files mirrored from buffalo/funet/ucsd daily)
nic.funet.fi pub/ham/info/faq_ham_[1-3]
located in Finland, FAQ updated monthly

Remember, when connecting to the remote system, use the login name of "anonymous" and, as a courtesy to the site administrators, your e-mail address for the password.

Option #3: Electronic Mail Server

If you can't use Options 1 or 2, your only remaining option is electronic mail. You can retreive a copy of the FAQ by sending a message to mail-server@rtfm.mit.edu

The body of your mail will contain a command for the mail server software. To get all of the FAQ (consisting of 70K of e-mail in 3 parts), place the following in the first line of your message:
send usenet/news.answers/radio/ham-radio/faq/*

Leave out the subject of your message because the mail server will ignore it.

--- begin sample mail message ---
To: mail-server@rtfm.mit.edu
From: me@here.org

Date: Mon Aug 14 22:27:33 PDT 1995

send usenet/news.answers/radio/ham-radio/faq/*
--- end sample mail message ---

Option #4: Mail List Subscription

If you prefer, you may get the FAQ and other periodic Ham Radio information as it gets posted. All the information posted to rec.radio.info can be obtained through the UCSD list server via the "radio-info" mail list. To subscribe, send an e-mail to
listserv@ucsd.edu
Similar to the e-mail server listed above, just send a single-line message
subscribe radio-info
If you need more information, the listserv program also accepts a "help" command. Just keep it on a separate line in the message.

Option #5: Gopher

You can access gopher servers on TCP port 70 (gopher protocol) at the following locations which carry the Ham Radio FAQ:
cc1.kuleuven.ac.be
jupiter.sun.csd.unb.ca
gopher.univ-lyon1.fr
ftp.win.tue.nl
gopher.win.tue.nl
For more information on gopher, see the comp.infosystems.gopher newsgroup.

Option #6: Wide Area Information Server (WAIS)

In addition to the other services mentioned above, rtfm.mit.edu offers a WAIS server on TCP port 210. Use the "usenet" database to access the FAQ.

For more information on WAIS, see the comp.infosystems.wais newsgroup.

Option #7: World-Wide Web (WWW)

The World-Wide Web (WWW) has experienced explosive growth in usage since early 1993. WWW clients like Lynx (in ASCII text) or NCSA Mosaic (X/Motif) can display the FAQ from many different sources. Each source is named by a URL (uniform resource locator.) The following URLs can be used to find the FAQ:
http://www.cis.ohio-state.edu:80/hypertext/faq/usenet

Other services listed earlier are also accessible with WWW at the following URLs:
news:rec.radio.info
file://ftp.amdahl.com/pub/radio/amateur
file://ftp.cs.buffalo.edu/pub/ham-radio
file://rtfm.mit.edu/pub/usenet/news.answers/radio/ham-radio/faq
file://grivel.une.edu.au/pub/ham-radio/buffalo/ham-radio
file://nic.funet.fi/pub/ham/info
gopher://cc1.kuleuven.ac.be/

gopher://jupiter.sun.csd.unb.ca/
gopher://gopher.univ-lyon1.fr/
gopher://ftp.win.tue.nl/
gopher://gopher.win.tue.nl/
wais://rtfm.mit.edu/usenet

For more information on WWW, see the comp.infosystems.www newsgroup. Also,
the help options on your WWW client should be able to point you to lots of
information all over the world.

Table of Contents

Dates indicate last modification.

Part 1 - Introduction to the FAQ and Amateur Radio
** Table of Contents (6/93)
** Introduction to the FAQ (11/92)
* How to Contribute to the FAQ Articles (6/93)
* Acknowledgements (6/93)
* Notes on "Netiquette" (1/93)
** What is Amateur Radio? (11/92)
** Who can become a ham? (6/93)
** Where can I locate information and books on Amateur Radio? (9/93)
** How much does it cost? (9/92)
** Where can I take the tests? (9/93)
** What are the tests like? (6/93)
** What can I do with a ham radio license? (5/92)
** What can't I do with an Amateur Radio license? (pre-4/92)
** I'm interested, who will help me? (11/92)
** Should I build my own equipment or antenna? (11/92)

Part 2 - Amateur Radio Organizations, Services, and Information Sources
** Where can I find Ham Radio information with a computer? (11/92)
* The rec.radio.* newsgroups (6/93)
* The ARRL e-mail server (1/93)
* The KA6ETB e-mail "HAM-server" (new 9/93)
* The Internet File Transfer Protocol (FTP) (9/93)
* Access to FTP archives via electronic mail (1/93)
* The Ham-Radio mail list: rec.radio.amateur.misc by mail (9/93)
* Telephone BBS's with Ham-related information (9/93)
* Callsign servers and geographical name servers (11/92)
* FTP access to FCC Part 97 and FCC Amateur Radio question pools (9/93)
* Lists of radio modifications and extensions (11/92)
** Can I send ARRL or W5YI electronic mail? (11/92)
** "Why doesn't the ARRL do...?" (11/92)
** What magazines are available for Ham Radio? (pre-4/92)
** How do I use the incoming and outgoing QSL bureau? (11/92)
** Are there any news groups for CAP? (11/92)
** What's the name of the QRP club that issues QRP numbers? (9/93)
** How do I become a 10-10 member? (9/93)

** How do I join MARS? (9/93)
** How do I join RACES? (pre-4/92)
** What organizations are available to help handicapped hams? (pre-4/92)
** I am looking for a specific ham, can anyone help me find him? (6/93)
** Can I post my neat new ham related program on rec.radio.amateur.misc?
(pre-4/92)
** Where can I get ham radio software for my computer? (9/93)
** Are there Dialup News services or BBSs for Amateur Radio? (4/92)
** Where can I find VE sessions in my local area? (9/93)
** Why isn't XXX available electronically? (4/92)

Part 3 - Amateur Radio Advanced and Technical Questions
** What are the different US amateur classes and what can each of them do?
(pre-4/92)
** What is the best way to learn Morse Code? (10/92)
** What is the standard for measuring Morse code speed? (pre-4/92)
** What is the standard phonetic alphabet? (new 9/93)
** I'm confused. What do all those abbreviations mean??? (6/93)
** What do all those "tones" mean? (pre-4/92)
** Where can I learn more about Amateur Radio if I live outside the US?
(9/93)
** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another
country (on vacation)? (9/93)
** My apartment or housing complex does not allow outdoor antennas, now what
do I do? (9/93)
** I got TVI...HELP!!! (9/93)
** Did you know that you can get college credit for being a ham? (pre-4/92)
** On what frequencies do JPL and GSFC retransmit the shuttle audio?
(10/92)
** Can I take my HT on an airplane and operate it if I get the permission
of the captain? (4/92)
** How do I modify my current Amateur license? (9/93)
** I'm confused about XXX, should I ask the FCC? (9/93)
** Is there any information on antique radios? (pre-4/92)
** Where can I buy vacuum tubes? (9/93)
** What do I need to get started in packet radio? (9/93)
** What do I need to get started in satellite communications? (9/93)
** What is available to get started in ATV, SSTV and WEFAX? (9/93)
** What are these contests I sometimes hear, and how do I participate? (9/93)

--Submitting changes for the FAQ--

If you have comments or updates for the FAQ, send e-mail to
hamradio-faq@amdahl.com
This will send mail to all the people on the FAQ editorial review group.

NOTE: The Effective Sunspot Number for 19 JAN 94 was 48.3.
The Full Kp Indices for 19 JAN 94 are: 3+ 5- 5o 3o 4- 2o 3o 3-

SYNOPSIS OF ACTIVITY

Solar activity was at very low levels. Region 7654
(N08E18) continues to be the largest and most active Region
on the disk.

Solar activity forecast: solar activity is expected to be
at low levels with a slight potential for an M class flare
from Region 7654 (N08E18).

STD: Magnetic shear near the northern end of the delta
within Region 7654 has remained relatively unchanged over the
last 24 hours. Although there is an outside chance for another
major flare from this region, nothing significant is likely to

be observed unless new flux emerges to perturb the current relatively stable configuration. This is further supported by the gradually declining background x-ray levels together with the relatively low frequency of small-scale flare activity and lack of spot growth.

The geomagnetic field has been at quiet to unsettled levels for the past 24 hours.

Geophysical activity forecast: the geomagnetic field is expected to be at unsettled to active levels.

STD: The field may become slightly disturbed on 22 January due to a negative polarity transequatorial coronal hole which is approximately one day beyond the central meridan. Periods of minor to major storming will be possible over the high and polar latitudes.

Event probabilities 21 jan-23 jan

Class M 10/05/05
Class X 05/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 21 jan-23 jan

A. Middle Latitudes
Active 40/45/15
Minor Storm 15/10/05
Major-Severe Storm 01/01/01

B. High Latitudes
Active 40/40/10
Minor Storm 15/15/05
Major-Severe Storm 01/01/01

HF propagation conditions were near-normal over all regions. Subsiding levels of geomagnetic activity prompted improved conditions over the high and polar latitude paths. Conditions should continue near-normal with only intermittent minor signal degradation for transauroral night-sector circuits. Signals are expected to become increasingly disturbed on 22 January if the anticipated disturbance from the well placed coronal hole noted above arrives. Poor to occasionally very poor propagation could occassionally exist over the higher latitude paths during that period. Otherwise, conditions should continue near-normal.

```
Date Begin Max End Xray Op Region Locn Sweeps/Optical Observations
------ ---- ---- ---- ---- -- ------ ------ --------------------------
19 Jan: 0615 0619 0623 B7.5 III
```

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max, and end times are defined as: B = Before, U = Uncertain, A = After. All times associated with x-ray flares (ex. flares which produce associated x-ray bursts) refer to the begin, max, and end times of the x-rays. Flares which are not associated with x-ray signatures use the optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

I smell fish here. The telephone companies have nothing to do with
Amateur Radio.
In my area, amateur radio clubs are required to pay business rates for
phone lines for repeaters. The only acceptions are if the repeater is at
your house or if the phone line is provided by the county or state. I
would be interested to know what this means also.

499. NEED VE in NYC area for 1/23 exam

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-21 05:49:23 UTC
From: popovich@prince.cs.columbia.edu
Message-ID: <POPOVICH.94Jan21004923@prince.cs.columbia.edu>
Source record: 272242

[Apologies if this goes outside the NYC area, but please note that I did include a "Distribution:" line.]

A VE who was to have worked our exam session this Sunday at Columbia University cannot make it to the session. As a result, we find ourselves one Extra class VE short. We currently have two Extra class and one or two Advanced class VEs available. If we cannot find another Extra class VE in the next few days, we will be forced to restrict our exam session to Novice and Tech exams only. If you are a VE in this area and would be available to help out at an exam session this Sunday, please let me know ASAP! Our session is coordinated with the ARRL/VEC, but due to the ARRL/VEC's "instant accreditation" policy, we should be able to use the services of any accredited VE -- you'd just have to fill out a short form, and give us a copy of your license and your VE credentials, to apply for instant ARRL/VEC accreditation. Surely there's one more VE in this huge city who would be willing to help us out. Your assistance at this session would be greatly appreciated! 73,
-Steve, WB3I
Columbia University ARC VE Team

500. Stolen TH-78A - Need your help!

Message-ID: <1994Jan21.002620.9071@pimacc.pima.edu>
Source record: 272246

Ham Radio Ops. in New York and Arizona please take note!

Returning from my trip from New York (LGA) to Phoenix via Philadelphia -
My baggage was lost by US AIR. When I picked up the luggage from
Tucson International where they had flown it via America West, my KENWOOD
TH-78A and a camera had been stolen. The Kenwood has my callsign on powerup -
N7QVL.

If you live in one of these three areas, !PLEASE! be on the look out for the
radio at swap meets and/or my callsign on the air.

I realize that this is a long-shot but I thought I would put the power of the
InterNet to the test.

Information concerning the radio or other recommendations can be E-Mailed
to me at....

MGRIFFITH@PIMACC.PIMA.EDU

Thanks - Mike

ps. Yes, a claim IS being filed with the airline. But I would like the thief
put UNDER the jail. :)

Source record: 272274
Cross-posted to: comp.sys.laptops,rec.radio.amateur.misc

Thank you everyone who responded by mail or news.

I> Are there any RS232C cards for PCMCIA slot?

> you may want to consider "dockable" laptops.

Unfortunately I've never heard of the docking station for my favorite
T1950. I am told that there are some serial interface cards for PCMCIA
(by IBM and others) but still don't have specific model numbers.

I> I'm also looking for PCMCIA Ethernet cards for 10base-2 (Coax)

I've got the info that there is one for T1950;
NWETH02 Noteworthy 10base2 PCMCIA type II Ethernet card.

> You could go with the old, yet trusty Xircom 10-Base2 external LAN
> adapter....

Oh, it might be even better if I can save a PCMCIA slot. Thanks!

I> FYI (to Hams only, probably contesters only): Why do I need so many
I> serial ports? Yes, I want to run CT (by K1EA) in multi-multi station.

I am informed that CT ver 8.47 has implemented a single-directional
loop which requires only one serial port per computer. If it works
fine, I don't need a serial port card nor an Ethernet card, i.e. the
best solution for me.

HOW TO FILE COMMENTS TO FCC NOTICES OF PROPOSED RULEMAKING

If you plan to file comments to an FCC Notice of Proposed Rulemaking, use the caption format shown below making sure that you put the appropriate Docket number at the top.

When you file comments or reply comments with the FCC, list your credentials, be fact-specific and to the point. When you file comments to an active NPRM, the FCC wants you to send an original and four copies. If you want each FCC Commissioner to have a copy, send an original plus nine copies. Send all comments and reply comments to:

Secretary
FCC
Washington, DC 20554

Caption to be used in filing formal comments:

Before the
FEDERAL COMMUNICATIONS COMMISSION
Washington, DC 20554

In the matter of)
)
(Insert a brief) PR Docket 93-###
description of)
what you are)
commenting on))

Details can be found in Chapter 15 of The FCC Rule Book. ARRL HQ and your ARRL Director would appreciate a courtesy copy of your comments and reply comments. See page 8 of any QST for his or her address.

QST de W1AW
DX Bulletin 5 ARLD005
From ARRL Headquarters
Newington CT January 20, 1994
To all radio amateurs

SB DX ARL ARLD005
ARLD005 DX news

The items in this week's bulletin are courtesy of Chod, VP2ML; The DX Bulletin; Bob, W5KNE; QRZ DX; Pat, WA8YVR; and the Ohio/Penn and Yankee Clipper Contest Club PacketCluster networks. Thanks to all.

ANGOLA. Kim, OZ1EYE, is active as D2EYE on 30, 40, 80 and 160 meters, both CW and SSB. QSL via OZ1ACB. Antonio, D2EGH, has been on daily around 14201 kHz between 2000 and 2300z. He chats with C91AI from time to time on this frequency. D2EGH checks into the 21335 DX Net around 1800z and 14205 kHz between 2100 and 2245z. QSL via CT1EGH.

BURKINA FASO. Peter, XT2BW, continues to warm the WARC bands, but will be leaving at the end of January bound for Ghana. Check 12 and 17 meters between 1600 and 1930z. He also works 3530 kHz around 2200z. QSL via WB2YQH.

ANTARCTICA. Aage, LA9YBA, has been operating 3Y9YBA from the Bluefield camp in the Tierro Mountains and making Zone 13 available to many. Check 10102 kHz at 0100z or 14250 kHz at 0245z. QSL via LA9YBA. Dinesh, VU3DEN/MM is believed to be a member of India's Antarctic Expedition team. Upon arrival he will be signing AT3D. QSL via VU2DVC.

RWANDA. F6EXV is signing 9X5DX, and F6FNL is on as 9X5CW. This operation should continue until March 1.

SAUDI ARABIA. HZ1AB gets on the top band from 1830 to 1835 kHz on Fridays starting around 0200z. QSL via K8PYD.

SPACED OUT? MIR has a new crew comprised of Commander U9MIR, Engineer R3MIR and Doctor U3MIR. The call sign R0MIR is used on packet and the Packet Mail System R0MIR-1. Listen to 145.55 MHz for passes of ''MIR''. QSL via

RV3DR, Serge Samburov, PO Box 73, Kaliningrad-10 City, Moscow Area, 141070, Russia.

SUDAN. G4OJW is the main operator of ST0K in Khartoum, believed to be the only legally licensed club station in the Sudan. The Sudan Amateur Radio Association, SARA, is being established and soon hopes to be able to deliver QSLs to Sudanese amateurs. The address for SARA is c/o Khartoum Airport, Box 73, Khartoum, Sudan.

CENTRAL AFRICAN REPUBLIC. TL8NG has been heard on the 3789 kHz Net at 2135z, 24935 kHz at 1700z, 18114 kHz at 1709z and 10107 kHz at 1945z. Another spot to try is 21335 kHz at 1445z or as late as 1745z.

OGASAWARA. JD1BIE has left Minami Torishima and will become active on Ogasawara. His length of stay is unknown at this time. He has been a regular on the 14226 DX Net and also checks into the 7062 DX Net run by VK stations between 1030 and 1200z.

SAINT LUCIA. Scott, N0JCL, will be on from January 28 to February 2. Check 3510 or 3795 kHz at 0900z; 7003 kHz at 1000z; and 14195 kHz at 1200z. QSL w/SASE via 1138 McAllister Avenue, Marinette WI 54143. DL5XAT and DL9XAT plan to be active on 160 through 6 meters with CW and SSB from March 5 to 17. If J6 calls do not come through they will operate as J6/DL5XAT and J6/DL9XAT. QSL via CBA or PO Box 1411, D-21454 Reinbek, Germany.

PREFIX HUNTERS NOTE. Nickolas, UX0FF, is on 3650 kHz every evening between 0300 and 0600z looking for stateside QSL via DF8BK.

CAYMAN ISLANDS. Bruce, K0BJ, will sign ZF2NJ from January 23 through 29, mainly on 15 and 20 meter CW. He also plans to be active on RS-12. QSL via Box DX, Colby, KS 67701.

PACIFIC DXPEDITION. Nob, JF2MBF, starts a one month journey on February 12. He and Yasu, JI1NJC, will operate from Tonga as A35JJ February 12 through 20; T23JJ from Tuvalu February 23 to March 1; T30JJ from Western Kiribati March 2 to 8; and C21/WK3D from Nauru March 9 to 14. Plans include 160 through 10 meter CW, SSB and RTTY, plus some Mode B satellite work. QSL direct or to JR2KDN via the bureau.

NEW ZEALAND. Jacky, F2CW, has visited Ron, ZL1AMO, and guest operated ZL1AMO on 7005 kHz at 0518z.

CONTEST DATE CORRECTION. To set the story straight, the CQ 160 Meter Contest will be on the weekend of January 28

through 30. The following are some tips for this event.

Mike, K4PI, will be signing P49I. Remi, FK8CP, will call for W and VE stations on 1842 kHz, listening between 1846 and 1848 kHz at 0320 and 1300z. P40W will be a multi-single effort by W2GD and K2TW. QSL via N2MM. AH6IO will activate Oahu on both CW and SSB.

THIS WEEKEND ON THE RADIO. The ARRL January VHF Sweekstakes runs from 1900z Saturday the 22nd until 0400z Monday the 24th. Work as many stations possible and exchange grid squares. For full contest rules, check page 128 of December QST. W1AW will be active on 50, 144, 222 and 432 MHz on Saturday afternoon.

507. Re: CW Books

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-21 12:40:51 UTC
From: connie2@freenet2.scri.fsu.edu
Message-ID: <2hoigj$1j0@mailer.fsu.edu>
Source record: 272085

No, you do not have to pass the 5 WPM test if you've passed the 13 WPM test.

Yes, you can go straight to General Class in one session, i.e., by passing the two written elements and the 13 WPM code test at one sitting.

Yes, it is a practical objective to aim your initial speed into the 13-15 WPM range. [I agree, 5 WPM and 13 WPM speeds do sound like two different languages. I find it very difficult to copy at speeds below 10 WPM..the characters just don't sound "right".]

Do become very familiar with the typical CW QSO format. It is what is used in administering the code test. Be able to identify call signs, signal reports, locations, equipment and names..all of these will be part of the code test.

Good luck,
Michael Christie, K7RLS
Crawfordville, Florida

I remember seeing somewhere, (Nova?), that if you tried to build the Ark of the Covenant from it's description in the Bible, you would wind up with a storage battery. Could you immagine some one who couldn't understand the concept of energy getting an electric shock. To him it would have been the power of God.

According to legend, there was a light on top of the great pyramid that burned for 600 years. Egyptologist found a small room with copper troughs in it that were lined with lead, and two wires that lead up to, where? When you think about it, a wet cell is a simple idea. It is conceiveable that some high priest of a once acient religion discoverd electricity and the knowledge was kept as a secret.

My demod for the DSP1232/2232 contains a sliding slicer, etc. for exploiting
this redundancy. This has been out for almost two years.

Bob

Why does one get let off if it was raining? Capacitance leakage? :)

|> Am I setting myself up for 'too much' work by skipping over the
|> 5 wpm rate?

I was just going to ask the same type question myself. I got sm404 working last night and am very happy with it. I'm especially happy with the SoundBlaster compatibility.. it does wonders for the quality of the tone. I heard a tip a while ago from someone to skip right over 5 wpm and start at 13. Most people have the innate capability to copy faster than five, so you won't be fighting yourself to stay too slow.

My question/suggestion: I don't know what code tapes sound like, but it seems to me that software could be written to, using the SoundBlaster card, roll your own code tapes. Obviously, I understand that there is human voice on the tapes, but a sentence library could be saved to disk and played at the appropriate times while creating the tape. Instead of buying six or seven tapes, you can create a new tape as you advance. Just make a few selections in the software, such as start speed and end speed, tone in Hz, and word spacing. If a person is sampled saying each character or procedural code once, the human voice could appear on the left track while the code is playing on the right track. (or vice versa since we drivers sit on the left in America) Or, some combination of volume of the code and voice can be made until it's "just right".

For non-instructional speech, the sampling rate can be done at 8MHz.. that's not the important part of the tape for sound quality, its the code that matters. And since the code is generated on the fly, it doesn't need to be stored anywhere.

This would also come in handy for groups as they teach a large number of people code. They can make custom tapes for everyone. And with a QSO library like SM's, a different QSO could be heard on every tape. The group could still fulfill their shareware obligations for the software without royalty for each tape produced, so long as they're not sold.

I had to turn off the DIT DAH display in SM because, as someone warned me not to do, I found myself counting them on screen and trying to remember. The key is what it sounds like. I even closed my eyes for a while.. that's when I came up with the idea for the custom tapes..

Does this sound like a good idea?

"Now here's a sample QSO at thirteen words per minute..."

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

Chart Start Date: Day #327

NOTES:
This graph is determined by plotting the greater of either the planetary
A-index or the Boulder A-index. Graph lines are labelled according
to the severity of the activity which occurred on each day. The left-
hand column represents the associated A-Index for that day.
Q = Quiet, U = Unsettled, A = Active, M = Minor Storm,
J = Major Storm, and S = Severe Storm.

NOTES:
The 10.7 cm solar radio flux is plotted from data reported
by the Penticton Radio Observatory (formerly the ARO from
Ottawa). High solar flux levels denote higher levels of
activity and a greater number of sunspot groups on the Sun.
The 90-day mean solar flux graph is charted from the 90-day
mean of the 10.7 cm solar radio flux.

520. Re: Portable 2m Antenna for Mountaineering???

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-21 14:47:21 UTC
From: zlau@arrl.org
Message-ID: <1994Jan21.144721.5694@arrl.org>
Source record: 272104
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

A simple dipole can be a surprisingly good portable antenna
if used intelligently. By adjusting the location and polarization,
you can often come close to the gain of a small beam. Since
a 2 meter dipole is small and balanced, it usually isn't too
difficult to hold it in the optimum position.

However, a beam makes more sense for setting up long distance
(200 to 500 mile) microwave contacts, where two or more antennas
have to be kept in alignment.

I've found that Cushcraft antennas can be folded into slender poles
if you loosen the elements, rotate them 90 degrees, and retighten
them. Unfortunately, you can lose hardware getting up the mountain.
Of course, many of these antennas can sacrifice an interior director
without losing any gain, so perhaps this isn't much of a worry.

My latest mountaintop antennas are built like the K1FO antennas with
retaining rings. The antennas will not fold up, but littering
the mountain with stainless steel hardware is less of a problem.

521. What's the best Iambic paddle?

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-21 14:51:06 UTC
From: hamilton@BIX.com
Message-ID: <hamilton.759163866@BIX.com>
Source record: 272250

It looks like the Bencher BY-x and Vibroplex Iambic models may be the largest sellers, but I happened to see a really intriguing iambic key by Schurr. It's made in Germany out of solid brass with a plexiglass cover. The detailing is superb to look at: everything looks hand-machined and fit together with precision. Then again, maybe it _should_ look pretty good at $150, compared to $90 or $100 for the Bencher and Vibroplex keys.

What makes for a good key? I presume this is a matter of personal taste, but okay, how _do_ personal tastes run? Any advice (short of buying them all and trying them myself :-) on deciding which I'd like best?

522. Re: ThickLAN Ethernet

Newsgroup: rec.radio.amateur.misc

|> loss, etc. It is the orange jacketed cable and is a little less than 1/2
|> inch dia.

Hi Brian,
I posted the original query back in the summer. Everyone was VERY helpful.
I got a bunch of the same stuff. If the jacket is translucent or thansparent,
it's probably teflon. Either way, it's good cable.
Here is a brief summary of what folks told me:

Impedance: 50 ohms (this I already knew from my networking background)
Loss at 50 MHz: 1.2 dB per 100 feet (better than most (including RG-213),
slightly worse than 9913) ... assuming Teflon
Velocity factor: 78 ... also assuming Teflon
Some questioned its ability to withstand UV from the Sun. Several people
replied that they've been using it for years with no signs of breakdown.

As you've probably noticed, the shielding is absolutely superb. Also, if you
have the Teflon stuff, you may actually *ENJOY* (!?!) soldering PL-259's on it.
You can heat it up with NO fear of ruining the cable. Try THAT with 9913!

If you picked up the cable for free, consider yourself lucky. This cable is
VERY expensive when purchased new. I remember forking out lots of our
company's money for this cable back in the Coax Age of networking. :-)
It's a shame, we have miles of this cable still in the ceiling ... unused.
Hmmm!

73 de Glenn, N3BDA

P.S. Before anybody flames me about using company cable for my ham shack,
This cable came from one of my wife's customers. She redesigned their
network and they gave her the old coax. It's nice to know that SOMEBODY
cleans out their ceilings!

523. LARC VP2E DXpedition '94

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-21 16:08:02 UTC
From: jimkelly@astro.ocis.temple.edu
Message-ID: <1994Jan21.160802.23716@cronkite.ocis.temple.edu>
Source record: 272093

FOR RELEASE 1 JANUARY 1994

For more information contact: Jim Kelly, KK3K (215) 978-5272

LARC Announces DXpedition to VP2E

The Lambda Amateur Radio Club (LARC), an international club for gay, lesbian, bisexual, transgendered hams, shortwave listeners and computer enthusiasts and their friends and supporters, will sponsor it's third DXpedition in March 1994 with LARC members planning to operate on HF and OSCAR-13 Mode B and Mode S from the Caribbean island of Anguilla, British West Indies. The team of operators and equipment are planning to be on the air March 5-10, 1994.

Planned operations will include multi-band and multi-mode HF and OSCAR-13 Mode B and Mode S. This may be the first OSCAR-13 Mode S DXpedition for the record books.

The operators making the trip will be Jim Kelly (KK3K), Don Bledsoe (WB6LYI), Mark Wilcox (KC3XC), Tom Hendrix (KI4ZN), Howard Wyman (W9BVD), Norm Gray (KF7IK), James Keeth (AF9A), and Wayne Schuler (AI9Q). QSL for all operators is direct to current Callbook addresses only.

In March 1992, LARC sponsored OSCAR-13 Mode B DXpeditions to Anguilla, British West Indies (VP2E) and Tortola, British Virgin Islands (VP2V) and logged over 900 contacts.

In March 1993, a second team of five LARC operators put the island nation of Montserrat (VP2M) on OSCAR-13 Mode B and logged over 1150 contacts.

To make contacting the LARC VP2E DXpedition even more exciting, the club will automatically mail an engraved certificate to every station who successfully works either any HF operator and any OSCAR-13 operator OR any OSCAR-13 Mode B operator and any OSCAR-13 Mode S operator during the DXpedition.

The club has members in nine countries and local chapters around the United States. For membership information, write the Lambda Amateur Radio Club International Headquarters, P.O. Box 24810, Philadelphia, PA, USA, or call (215) 978-5272.

Brian... Thick Ethernet Coax is 50 ohms of impedence...
Belden's ethernet coax is #9880... I think the orange colored one
that you have is of the plenum type which is used for direct burial
or outside use...
The usual color for indoor use is yellow... although you can get it
in any color if you special order...

Regards...

526. The differences in CW filter performance

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-21 17:16:54 UTC

I don't know about Icom specifically, but this is generally
not true of consumer electronics. The published specs for
most electronics represent an average based on samples
taken from the production run. The statement at the end of
the specs that says "Specifications subject to change without
notice" really means "Your radio may not do this well". Only
a very few manufacturers offer "guarenteed specs", in which
each and every unit is guarenteed to meet the spec. When I
bought a stereo receiver a while back, I went with Tandberg
because unlike almost every other manfacturer, they
guarentee their specs. Check the spec sheet for the radio in
question; if it doesn't say they're guarenteed, they aren't.

I can just about guarantee you that no off the shelf VCO would even come
close to these specs.

You'll have to build your own using an MRF931 transistor and an MV1404 tuning
diode. I'd pick the 5 volt supply over the 3 volt supply. Allow a day or two
of design time.

Of course, you do realize that +8 dBm is 90 milliwatts and you are asking
for a maximum power consumption of 90 milliwatts at 3V or 100 milliwatts at
5V. Those specs are incompatible. You'll either need to allow more DC in or
less RF out. I would say you could probably get +4 to +6 dBm. with your DC
constraints if you worked at it.

I love these kinds of problems because they refute the notion that some managers
have that you can build systems by buying all the blocks and putting
them together like tinkertoys. No, I'm sorry, but some engineer is actually
going to have to *design* something this time.

>Instead of ragging on Internet which Ramsey may not see, how about

I think if I owned one of the major ham radio businesses, I'd make
it my business to see internet discussions about ham radio. It's
as important as, say, reading QST.

>convincing John that he needs to upgrade the designs? If more hams
>buy his designs after the upgrade you can bet he will do it.

True, but there is a certain expectation of initial quality. Unfortunately,
John Ramsey has not come across as well as he might to some of the
readership here. Worse yet, he managed to send something to QST for
review which was, put simply, illegal. And he tended, at least as
reported here, to downplay the issue. I suspect someone receiving a
Notice of Apparent Liability from the FCC would not consider it
to be trivial.

> But, like
>the Corvair, bad publicity can destroy a product even though it was
>upgraded to a very good product.

Dangerous analogy, this. After all, the evidence suggests that GM
knew there were problems, and let people go ahead and die. Yes,
they eventually fixed the car, and apparently put their best people
on it, considering what a nifty product the last ones were; but did
their having done so only after their customers were killed and maimed,
and following a huge cover-up speak of a product that deserved success?

I don't think so. Consumers were right in avoiding a product where
the manufacturer conspired to hide defects, historically. Trust,
once lost, must be re-earned.

I love to see responsive, responsible, and honest businesses succeed.
Particularly since they seem to be somewhat of an endangered species.
From what I've seen, I haven't been able to determine if Ramsey is
one or the other.

531. Re: CW filters and DSP-9

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-21 18:34:27 UTC
From: yee@mipg.upenn.edu
Message-ID: <YEE.94Jan21183427@mipgsun.mipg.upenn.edu>
Source record: 272080

I ask a poorly phrased question:
>When I look at CW filters, I see advertised bandwidths of between circa
>250Hz to 600Hz. What are the difference?

A poster replies:
>The 250 Hz ones have a bandwidth of 250 Hz and the 600 Hz ones have a
>bandwidth of 600 Hz. That are[sic] the difference. What do you mean?

I am asking about the difference in CW performance. Is a narrower
filter easier to copy or a wider one?

...and f'god's sake give people an option outside of the diode matrix.

Even if it's an add-on kit. A friend of mine and I drew up an arrangement
that used a couple of EPROMs and a thumbwheel switch to twiddle the PLL
lines. Would have cost fifty or so bucks and a lot of time to make one,
probably twenty bucks each in 500 quantity.

HAMFEST CALENDAR 1993/4 - NORTHERN ILLINOIS
last updated December 9, 1993

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (708)979-5414, electronic mail: parnass@ih4gp.att.com.

JANUARY 1994

Jan 30, Sunday: Odeum, Villa Park, IL - Wheaton Community Radio Amateurs hamfest. Odeum Expo Center. 8 AM - 3 PM. Tickets $6 advance, $8 at the door. VEC testing. All flea market tables reserved. To reserve a table, call (708)231-2428.

(Note for Bell Labs folks: John Broughton has tickets. Call him at 713-4319 for info.)

FEBRUARY

Feb 20, Sunday: Rock Island, IL - Davenport Hamfest, QCCA Expo Center, 2621 4th Avenue, Rock Island. Admission $5. Info, SASE to Kent Williams, 4245 10th St., East Moline, IL 64244.

Feb 26, Saturday: LaPorte, IN - Cabin Fever, LaPorte Civic Auditorium. LaPorte Amateur Radio Club. 8 AM. Setup 6 AM. Admission $4. Talk-in 146.61 MHz. Info: LPARC, POB 30, LaPorte IN 46350.

April 29, 30, and May 1: Dayton, OH - Dayton HamVention. Hara Arena, Information, General: (513) 276-6930, Flea Market: (513) 276-6932 (Reservations not accepted by phone). Write: Hamvention, Box 964, Dayton, OH 45401-0964.

Advance Registration: Checks in $US, payable to Dayton Hamvention. Send name, address, call, and day and evening phone numbers. Enclose separate checks for admission and Flea Market.

Be sure to indicate either: Send admission tickets ONLY if flea market space assigned. Send admission tickets REGARDLESS of space assignment. Admission: $11.00 per person ($14.00 at door, good all 3 days). Banquet: $22.00 per person ($24.00 at door, if available). Send

to: Dayton Hamvention, Box 1446, Dayton, OH 45401-
1446.

JUNE

June 12, Sunday: Willow Springs, IL 6 Meter Club Ham-
fest, Six Meter Club of Chicago. Santa Fe Speedway,
91st Street and Wolf Road. Admission $5. Gates open
6AM. Talk-in on 146.52 simplex or 146.97 repeater.
Info, call Joe Gutwein, WA9RIJ, at (708)963-4922.

JULY

July 24, Sunday: Stickney, IL - DuPage ARC hamfest,
Hawthorne Race Course, 3500 South Cicero Ave. Handicap
accessible. Starts at 6 AM. Talk in on 142.25 MHz
with 107.2 PL. (-600). VE Testing 9 - 12. Advance
tickets are $4.00, $5.00 at the door.

This hamfest used to be held at the American Legion in
Downers Grove and was a good small to medium-sized ham-
fest. This year, there will be a 30,000 square foot
indoor exhibit area in an air conditioned building,
plus outdoor tailgating.

For advance tickets, send check payable to DARC,
enclose SASE, and send to Hamfest 94, 7511 Walnuut Ave,
Woodridge, IL 60517. For commercial or fleamarket
tables info, call 708-985-9256.

>as large a fraction in the price of electronics nowadays.

...Which leads to another suggestion. Perhaps Ramsey could offer a 'semi-kit' with the board stuffed, tested, and aligned. Work out your own case and add-on arrangements. Stuffing and wave-soldering a PC is a miniscule amount of the labor, compared to attaching the outside wires and getting a persnickety case together.

>If I pass the 13 wpm test, do I also have to pass the 5 wpm
>test? Or in other words; Can I get a General class license
>by passing the written tests for Novice, Technician and
>General and then pass ONLY the General CW test?

As I've just take the Amateur Extra test (and PASSED!!!), I think I can answer this. (Along with many other people I suspect...)

NO!! You do not have to take the 5wpm code test [Element 1(a)]. The only elements you must have credit for to get a general license are:

1(b), 2, 3(a), and 3(b).

This is all spelled out, and covered by the Amateur Extra test (for those who are interested).

* STS-60 ASTRONAUTS ISSUED HAM CALL SIGNS *
==========

Astronauts Charles F. Bolden, Jr. of Columbia, South Carolina and Ronald M. Sega of Seabrook, Texas, have been issued amateur radio call signs in preparation for their joint U.S.-Russia science mission. The Spacehab science objectives are primarily micro-gravity oriented with emphasis on materials and life science.

Bolden, KE4IQB is commander of the space shuttle Discovery (OV-103) due for lift off on February 3, 1994, at 12:10 UTC from Cape Kennedy. Sega (now KC5ETH) is the second of four Mission Specialists. They plan to contact several schools as part of the SAREX program - including one in Russia.

The flight of STS-60 represents an historic first, the first of several joint U.S.-Russian Space Shuttle flights planned in preparation for the development of the international Space Station. Veteran cosmonaut Sergei Krikalev, U5MIR, was chosen to be the first Russian to fly on the U.S. Space Shuttle. During the 8 day flight, Cosmonaut Krikalev will support the science operations on the Space Shuttle as Mission Specialist 4.

Last year, Sergei attended the Dallas Ham-Com convention and told us he would try to qualify for a U.S. license - but his training duties have prevented him from doing so. Since no reciprocal operating privileges exist between Russia and the United States, Sergei will operate amateur radio under Bolden's control operator authority. The possibility also exists for the first U.S. Space Shuttle to Mir Space Station (Russian astronaut-to-Russian cosmonaut) amateur radio contact!

Three new Russian amateurs were launched on January 8, 1994 aboard a Soyuz rocket and docked at the MIR space station on January 10th. The new crew includes Viktor Afanasiev (commander) U9MIR, Yuri Usachev (flight engineer) R3MIR and Valerij Polyakov (doctor) U3MIR. They are using the call sign R0MIR on packet.

[Info via Fred, W5YI]

* FUJI-FAX *
============
With the Fuji-OSCAR-20 satellite schedule providing extended periods of analog (Mode JA) transponder operation, Ted (G6HMS) and Ian (G0NKA) in England have been exchanging FAX images through this satellite.

At first, the technique was a bit "iffy", but Ted and Ian gradually got the hang of following the doppler on the downlink to hold the picture. Unlike voice transmissions where the ear is relatively tolerant of frequency change, the same cannot be said for computers decoding FAX signals.

Ted and Ian initially started out exchanging black and white images with no grey scale. After correcting some transmission problems, images containing 256 grey levels were exchanged, and finally FULL COLOR FAX images were exchanged!

Ted and Ian used JV-FAX 6.0 software for making FAX transmissions, and a Shareware version of Microfax on receive. Both stations used an uplink on 145.980 MHz (LSB) which produced an FO-20 downlink on 435.820 MHz (USB).

If you have FAX capability, you are asked to join Ted and Ian as they exchange FAX images through the FO-20 satellite.

[Info via Ian, G0NKA @ GB7DTX.GBR.EU]

* SUPERBALL 1-94 UPDATE *
=========================
The attempt to recover the SuperBall 1-94 balloon and payload on Saturday 15-Jan-94 failed. Numerous troubles plagued the effort and they basically just ran out of day-light and had to turn back. Another attempt was made on the 16th) which was successful! All of the critical elements of the craft were recovered.

Preliminary reports indicate that another launch will take place in about a month's time.

[Info via Kris Nosack, N7SHV]

* STS-60 SAREX INFO *
====================
Mission: STS-60 Space Shuttle Discovery
Vehicle: OV-103/Discovery
Wake Shield Facility & Spacehab-2 Mission
Launch: February 3, 1994, 12:10 UTC from KSC Pad A
Landing site: KSC
Orbit: 57 degree inclination
Orbital altitude: 218 sm
Mission Length: 8 days (Nominal)
Crew size: 6

Amateur Radio Operators: Charlie Bolden (License Pending), Ron Sega (License Pending), Sergei Krikalev, U5MIR

Modes: FM Voice
Prime callsign: To be provided once Commander Bolden's callsign is known

Packet Radio: Callsign W5RRR-1

Frequencies: All operations in split mode. Do not transmit on
the downlink frequency.

Voice Freqs: Downlink: 145.55 MHz (Worldwide)
Uplinks: 144.91, 144.93, 144.95, 144.97,
144.99 MHz (Except Europe)
144.70, 144.75, 144.80 MHz (Europe only)

Note: The crew will not favor any specific uplink frequency, so your ability
to work the crew will be the "luck of the draw."

Packet Freqs: Downlink: 145.55 MHz
Uplink: 144.49 MHz

[Info via KA3HDO]

* FO-20 OPERATION SCHEDULE *
============================
The FO-20 operation schedule is follows. Analog transponder and digital
transponder will be ON for a week respectively as they were since last
December.

Analog mode:
26-Jan-94 08:20 UTC -to- 02-Feb-94 06:50 UTC
09-Feb-94 07:15 UTC -to- 16-Feb-94 07:40 UTC
23-Feb-94 08:05 UTC -to- 02-Mar-94 06:40 UTC
09-Mar-94 07:05 UTC -to- 16-Mar-94 07:30 UTC
23-Mar-94 07:52 UTC -to- 30-Mar-94 08:15 UTC

Digital mode:
Unless otherwise noted above.

[Info via Kazu Sakamoto, JJ1WTK]

546. DSP Audio Filters

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-21 21:38:09 UTC
From: mikemr@microsoft.COM
Message-ID: <9401212140.AA04274@netmail2.microsoft.com>
Source record: 272262

I have an IC-765 with the 250Hz optional CW filters. I use a Timewave DSP-59 with it, although I modified the radio so that the DSP is ONLY in the detector audio branch (not in the monitor audio---I didn't like what it did to my sidetone!).
I find that it's extremely effective filtering the background noise on the higher
bands, less so on 160/80/40 (the noise characteristics are very different on the
low bands). I find that 99.9% of the time I just keep the DSP in line, in the noise
reduction position (I'm 99.9% CW). It's really nice to use it on SSB to eliminate
carriers, assuming the carrier isn't louder than the DX I'm trying to hear. The white noise reduction mode works very well, reduces fatigue, and actually helps pull some weak signals through the background noise.

I don't use the super-narrowband CW filters very often. They don't give any significant improvement over the 250Hz crystal filters in the rig's IF (and the IF filters ring less). The notch filter in the rig is also preferable for heterodynes
because the IF won't pump as it does with the DSP.

All in all, I think the DSP-59 is worth the investment, especially if you modify
your radio so that it only DSPs the detected audio.

I just talked with Art and Millie Gentry. Art is w6mep and I've forgotten Millie's call. These are the folks that put the first Los Angeles two-meter repater on the air in the mid.fifties and are very special folks to a lot of us that hung out there...

Both are fine and only had modest damage to things... other than the kind of mess that happens when racks and such get slammed about by an earthquake.

Angelo_Glorioso_Iii@agwbbs.new-orleans.LA.US (Angelo Glorioso Iii) recently asked:
> I am looking for a Contest logger that will support ARRL format for
>electronic filing for ARRL RTTY ROUND-UP contest. If you know of one,
>please let me know where I can ftp it??

To which someone (unsigned posting) replied:

>I'm told the standard by which all others are judged is CT by Ken
>Wolff, K1EA, at 221 Old Littleton Road, Harvard, MA 01451. I don't
>know if it's available for download anywhere, but I'm sure you could
>contact Mr. Wolff directly.

There is an ancient version of CT out there for free, but CT is now a commercial product. You've got the author correct, but the latest information for ordering or inquiries is

K1EA Software
5 Mt. Royal Ave
Marlborough, MA 01752
508 779-5054

There is also a CT bbs which will give you the latest updates, ordering information, etc. The bbs number is 508 460-8877. The bbs won't do you much good other than finding out how to order, price, etc. unless you are a registered user of CT.

Of course, I have no affiliation with K1EA Software, Harvard Radio, Inc., K1EA, etc. I just thought that people would like to know where to find out more about CT...

549. CW filters and DSP-9

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-21 22:36:55 UTC
From: oo7@astro.as.utexas.edu
Message-ID: <2hple7$ti@geraldo.cc.utexas.edu>
Source record: 272276

yee@mipg.upenn.edu (Conway Yee) asks:

>>When I look at CW filters, I see advertised bandwidths of between circa
>>250Hz to 600Hz. What are the difference?

The 250 Hz ones have a bandwidth of 250 Hz and the 600 Hz ones have a
bandwidth of 600 Hz. That are[sic] the difference. What do you mean?

Ref the DSP-9 postings, I have used mine a few times and am still not
sure that it is doing anything for me on CW. It's cute having a 100 Hz
width filter but, as someone mentioned, when it cuts out your sidetone
you think twice about using it. So far, I've found that the fiddling
around adjusting the receiver output for signals of different level as
well as playing with the gain on the DSP-9 is distracting when tuning
the bands. There is a narrow range of signal strengths where the DSP
really helps. If the signal/noise is already 10 I don't need it to be
100, and when it's 1, the DSP doesn't really help. I need to play
with it some more, I'm sure.

It should be useful on phone, when I get around to that. Taking out
the jammers and tuners-up on top of DX stations is useful, but it's
not saying much for the state of amateur radio if the DSP boxes are
primarily of use for removing deliberate human (or quasi-human) QRM.

As far better ops than I have said, sometimes the best filter is the
one between your ears.

There are two:
mudgate.imsa.edu 2000
plan9.njit.edu 2000

The first one tends to be a little more current, but they are both set up the same way. If you're calling from Delphi, there should be a way to get right into one of the servers. Before the rebuilt some of the menus, there was an auto-telnet for it.

: Conway Yee, N2JWQ

Hi Conway, I have both 250Hz and 500Hz CW filters and I prefer the 500Hz.
The center frequency 750Hz component in the background noise bothers me with
the 250Hz and it does ring worse than the 500Hz filter.
The big boys tell me that 250Hz filters are for "really serious CW".
I'm hardly ever serious.

>I am asking about the difference in CW performance. Is a narrower
>filter easier to copy or a wider one?

This is a matter of personal taste for many of us. I really prefer the narrower, my favorite filter is the Kenwood 270 Hz filter in the TS 430. The 500 Hz filter is fine, though, especially with IF shift or PBT (though there is a difference in PBT and IF shift that seems to make PBT much preferable :-). The filter can do two things for you :

1. Eliminate QRM nearby
2. Quiet down the background noise.

Reference number 2, some filters don't do so well at this, and some narrow filters have a "ring", or hollow sound to them. Many don't like this at all. Most IF filters don't have much ring, though some, many audio filters (except DSP I understand) can ring pretty badly.

My two cents.

From: horak@src.dec.com
Message-ID: <2hpu92$sna@src-news.pa.dec.com>
Source record: 272083

The SF Chronicle article is a bit misleading.

Pacific Bell will offer a residence-tariffed line to anyone operating an Amateur Radio repeater with a phone line used for autopatch, even if the phone line is located in an obviously non-residential location.

This saves you ~$1.17/mo on the "Interstate Access Charge", and gives you unlimited zone 1 & 2 dialing if you order a flat-rate line. Business service does not have a flat-rate tariff, so you pay for all local calls.

Most business offices don't know about this. I just converted two phone lines that I'm responsible for, and went through a fun maze of employees to get it done. One of the major players is currently swamped with LA quake stuff, but email me directly if you have a repeater and want more info about how to go about getting this type of service.

GTE also offers this service anywhere in the US, but I don't have any experience with them in this regard.

NOTE: The Effective Sunspot Number for 20 JAN 94 is not available.
The Full Kp Indices for 20 JAN 94 are not available.

SYNOPSIS OF ACT

Solar activity was very low. Region 7654 (N08E09)
produced several subflares and appears to be rotating
counterclockwise, but has remained mostly stable in white
light and H-alpha. New Region 7657 (N12W20) emerged
rapidly on the disk. It is magnetically simple but with an
east-west inversion line. A dark filament near S23W03
disappeared between 1747 and 2015 UT.

Solar activity forecast: solar activity is expected to be
low. Eruptive events are expected from Region 7654 and possibly
from 7657, if rapid growth continues in that region.

STD: Region 7654 has shown only minor changes over the last 24
hours. Magnetic gradients and shear remains strongest near the
delta along the predominantly east-west oriented neutral line.
An M-class flare remains a possibility from this region.

The geomagnetic field has been at mostly quiet levels
for the past 24 hours. Activity that was expected from an
isolated, equatorial coronal hole has not occurred.

Geophysical activity forecast: the geomagnetic field is
expected to persist at quiet to occasionally unsettled levels
throughout the forecast period. Today's filament disappearance
will be evaluated for possible effects on 25-26 January.

Event probabilities 22 jan-24 jan

Class M 10/10/10
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 22 jan-24 jan

A. Middle Latitudes
Active 25/10/10
Minor Storm 05/05/05
Major-Severe Storm 01/01/01

B. High Latitudes
Active 25/10/10
Minor Storm 05/05/05
Major-Severe Storm 01/01/01

HF propagation conditions were near-normal over all
regions, although persistent occasional minor signal
degradation over the high and polar latitude night-sector
paths has continued. Effects from the anticipated coronal hole
disturbance have not yet arrived, and there is a possibility
it may not arrive. If it does arrive, only a minor impact is
expected over the high and polar latitudes. Otherwise,
near-normal conditions should continue over all regions.

Any Particular reason you picked the MRF-931? We've been using MRF941's in
even lower power applications, and getting what we consider good results.
Sorry, no spec's off the top of my head.

560. PROJECT 14: THE WORLD'S SMALLEST TRANSMITTER

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-22 05:57:06 UTC
From: jherman@uhunix3.uhcc.Hawaii.Edu
Message-ID: <CK0oJ6.5Do@news.Hawaii.Edu>
Source record: 272077

Gang,
If there was a contest to come up with a xmtr containing as few
parts as possible, this would be the winner: 10 parts if you include
the key, battery, and antenna!
In the CODE/NO-CODE debate on r.r.a.policy some pro-coders will
mention the simplicity of CW xmtrs as opposed to those of other modes;
this circuit really drives that point home (that's why I'm posting this
on .policy)
On r.r.a.misc we've heard talk about how costly ham gear is today - all
this rig will cost you is the effort to find an old color TV chassis -
that's the parts source for all my QRP transmitters (and this is why I'm
also posting this on .misc).
Normally I post these xmtrs only on r.r.a.homebrew and on the QRP
mailgroup; so if you've missed the first dozen xmtr circuits email me
and I'll send them off to you.
I built this for 80M only because I've got so many 3579 kHz crystals
from old TV sets, but this can be used on any HF band - just choose
L and C to resonant at the crystal frequency.
For peace of mind you might want to add a bandpass filter to the
output.

|
GND

Again, choose L&C to resonant at the desired frequency; one of the two should be adjustable. I got both from the chromatic board of a TV - both were sitting next to the 3579 kc xtal; easy, huh? I didn't use a 2N2188 transistor; rather, I used a x-sistor right off the video board (of the TV).
So, don't you dare buy one component for this - just dig through your junk box (or your neighbor's trash for an old TV). With a good antenna (those are the magic words in QRP work) this little peanut-whistle will provide hours of pleasurable QSO's.
Oh, 3579 kc has become a national QRP frequency due to the easy availability of these crystals.

.... .- ...- . ..-. ..- -.

72,
Jeff NH6IL

VK2SG RTTY DX Notes, 21 January
VK2SG RTTY DX Notes for week ending 21 January 1994 (BID RTDX0121)

Our information this week came from ZS5S, 9X5LJ, WB2CJL, I5FLN, DJ3IW
and the Central EU DX-Cluster DB0SPC, IK5AAX and the IK5PWJ Packet
Cluster, and the NJ0M node of the Twin Cities DX Packetcluster
Network. Thank you all for your help.

Notes of Interest:

All the team members of the Peter I DXpedition have assembled at the Falkland Islands and are preparing for a 23 January sailing, with an anticipated landing on the island of 1 February, +/- ice and weather. Departure will be 12-14 February. RTTY frequencies for 3Y0PI will be 1825, 3680, 7070, 14080, 21080, and 28180 KHz. They will be listening up. Other mode frequencies are: CW-1826, 3522 (US), 3507 (EU), 7022 (US), 10104, 14024, 18074, 21024, 24894, 28024. SSB-1845, 3785 (US), 3800 (EU QSX down), 7065, 14195, 18145, 21295, 24945, 28475. Satellite-(QSX down) 145.890 (AO-10 and AO-13). Look for them as VP8BZL/MM while they are enroute to the island. QSL both VP8BZL and 3Y0PI to AA6BB.

St. Peter and St. Paul Rocks - This all band/all mode expedition was scheduled to have started on 20 January for a two week stay, but has now been again delayed to start 1 February. QSL RTTY contacts to PS7KM.

Send your Bandpass and Notes of Interest for next week's bulletin to Luciano, I5FLN @ ZS5S.ZAF.AF or I5FLN @ 9X5LJ.#KGL.RWA.AF.

First a credibility check. I've spent about 25 years fixing, designing,
maintaining, and swearing at radio and computers. I've designed
approximately 20 different RF products. I've also worked for a
kit manufacturer and know the economics of kits.

1. Any company that does NOT make a profit will not last too long.

2. You cannot buy the PARTS for a typical Japanese transceiver
for what they sell for in the quantities that Ramsey sells. The
bulk of the economy of scale is in the large quantities manufactured.
Were I to take a typical radio and just bag the parts in kit form,
the cost would be MORE than the assembled version because the
cost of packaging, handling, labeling, inspection, component testing,
and documentation would be MORE than the finished, robot assembled
unit. Heathkit discovered this near the end when they "kitted"
commercial products and discovered it would cost MORE than the
assembled product.

3. You cannot compare a 40meter (7Mhz) design QRP design with a 146Mhz
25watt design. The higher frequency and power make construction,
component tolerances, and mechanical considerations far more critical.
I've played with some assembled Ramsey kits and found the construction
technique to vary radically from builder to builder. One board must
have held a pound of solder. Another had some parts fall out.
The "quality" of the end product is highly dependent upon the builder.

4. Consistancy is difficult to achieve. This is because of
accumulated component tolerances. Volume manufacturers compensate
for this with incoming inspection, grading, post-assembly
component value selection, and statistical performance analysis.
A small kit manufacturer cannot do any of these economically.
What it usually done is to use low gain, low impedance, inefficient,
and broad band design with a large number of adjustments to compensate
for component and construction variables. The result is increased

cost.

5. A kit manufacturer is actually a book publisher that happens
to include some parts and pieces with the instruction manual. The
cost of producing a Heathkit style assembly manual would bankrupt
any small manufacturer. I do not consider the Ramsey instructions
to be even adequate, but expect improvements with time.

6. The Ramsey kits are not state of the art, high quality,
or a fabulous bargain. They are adequate for the purpose intended:
a kit for those that still believe that radio construction is a
part of ham radio and that believe they may profit from the
experience. If the lack of accessories is offensive, please
consider that anyone who builds their own equipment, is quite
likely to have a supply of suitable microphones, speakers, and
boxes.

He's already famous on "ca.earthquakes" -- as a publicity-seeking crazoid with very little credibility. Check out that newsgroup for the full text of his "prediction" if you want a good laugh. He applies some concepts in radio theory that were somehow omitted from the ARRL Handbook.

BTW, he's predicting a 6.0 for the San Francisco Bay area for next Sunday, Janauary 23, give or take 19 hours. We'll see....

> Reference number 2, some filters don't do so well at this,

The filter bandwidth (which is usually defined as the bandwidth between the points where the frequency is -6 dB down from the maximum in the pass band) is not the only figure-of-merrit to look for. Equally important is the shape of the frequency response above and below the quoted bandwidth. This is usually specified with the -60 dB bandwidth and it indicates how much background noise will get through.

There are 250 Hz (at -6 dB) filters with a 1.2 kHz -60 dB bandwidth and there are 500 Hz filters with a 800 Hz -60 dB bandwidth, so look carefully at the specifications. Despite broader passband, the latter filter is more effective to quiet down background noise and interfering signals a few hundred Hertz or more above or below the passband.

Some manufacturers specify the passband bandwidth and the frequency offset from the center of the passband where the frequency response is -60 dB down, in the previous example +/- 600 Hz resp. +/- 400 Hz. Some even omit the +/- signs so that the figures look better. You can easily get the impresion that (+/-) 600 Hz is better than 800 Hz (total) bandwidth, so be carefull.

Instead of the -60 dB bandwidth, sometimes the shape factor is given, which is simply the ratio of the -60 dB bandwidth to the -6 dB bandwith. The shape factor for the first example is 4.8 and 1.6 for the latter.

In some cases the shape factor is given at a smaller attenuation e.g. 50 dB/6 dB to get smaller (and better) figures.

Thus, it is very hard to select filters solely on the basis of passband bandwidth.

As Clark pointed out in the begginning it is also a matter of personal
taste.

What should the audio filter frequency (and phase response) look like
to avoid ringing. A high-Q single stage bandpass sounds horrible, but
how does a filter with flat passband (eg. Butterworth or elliptic)
sound like or is it really required to use Bessel-response in order
to get rid of the hollow sound produced by noise peaks.

>Any Particular reason you picked the MRF-931? We've been using MRF941's in
>even lower power applications, and getting what we consider good results.

The MRF-931 is optimized for low currents. It still has good
gain and f-sub-t down to .1 mA. This should allow a larger
current swing than the 941, which has little gain at .1 mA.
You want to approach a swing of 4 mA. peak to peak when using
2 mA. DC collector current for maximum efficiency. To do this,
you need to get as close to 0 mA. as possible.

For "normal" uses, we love the MRF941. We use it (actually the
SMT version MRF9411L) practically "everywhere" in RF circuits.
Just watch what you hang on the base so it doesn't take off at 3
GHz! The MRF931 is more "idiot proof" in this respect.

Message-ID: <f7.10514.1807.0NFAB097@mpoli.fi>
Source record: 272118

Would it be possible to build a _simple_ converter, located between antenna and receiver, which would convert incoming FM (with 18-20kHz deviation) to WFM (75kHz deviation)? It should cover frequencies from 137 to 138MHz. It's just that the signals from the NOAA satellites are so weak that I can't get any useful pictures with signals received in WFM mode. (to me the sound isn't that noisy, go and figure)

576. No-Code Tec. license

Newsgroup: rec.radio.amateur.misc

I want to go for my No-Code Tech. license (First, I'm 13, second, I don't know code well) and someone showed me a book. I think it was called "Now Your Talking", but I'm not sure. I really want to find out how to get started with some cheap, but good equipment. What is the name of the booklet at Radio Shack that I can get?

The Full Kp Indices for 21 JAN 94 are: 2o 3- 1+ 1- 1+ 2- 3- 2o

SYNOPSIS OF ACT

Solar activity was low during the past 24 hours. Region
7654 (N09W06) produced the only C-class x-ray event observed
but has lost its delta magnetic configuration. Two new regions
were numbered. Region 7658 (N12E16) is a simple bipolar group.
Region 7659 (S13E47) was spotted briefly but is presently only
plage and an arch filament system. Several unassociated Type
III radio sweeps, and discrete radio bursts were reported. A
large, inactive prominence is rotating over the east limb.

Solar activity forecast: solar activity is expected to be
low. Region 7654 retains the potential for occasional eruptive

flares.

The geomagnetic field has been at mostly quiet levels at
middle geomagnetic latitudes for the past 24 hours. Some
periods at active levels were observed at auroral latitudes.

Geophysical activity forecast: the geomagnetic field is
expected to be quiet for the next three days. Active conditions
are possible on 26 Jan in response to disturbed solar wind
associated with a filament disappearance on 21 Jan and an
equatorial coronal hole which will be near central meridian
on 23 Jan.

Event probabilities 23 jan-25 jan

Class M 05/05/05
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 23 jan-25 jan

A. Middle Latitudes
Active 05/10/10
Minor Storm 01/05/05
Major-Severe Storm 01/01/01

B. High Latitudes
Active 05/10/10
Minor Storm 01/05/05
Major-Severe Storm 01/01/01

HF propagation conditions were normal over all regions.
Near-normal conditions should persist over the next 72 hours.
High latitudes may begin seeing effects of the above-mentioned
disturbance on 25 January. Otherwise, near-normal conditions
are expected to continue.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

>experience.

Exactly. I picked up a pair of Ramsey's (2m, 440) to run on packet. Why? For one, it seemed silly to buy an all-singing all-dancing 400 memory PL rig just to wire down onto one frequency for packet. The Ramsey kit is easily interfaced to a packet modem.

As for price, the Ramsey kit is marginally less expensive than a comparable single band radio WITH THE SAME FEATURES. I defy you to find a commercially manufactured 2m (or 440) rig, with as few features as the Ramsey, to compare the price to. When you do, *then* we'll argue about the relative expense of the Ramsey kit.

I agree that the front end on the Ramsey kit is wider than it should be. I was aware of this from the outset. Prior to buying it, I asked around about it's good and bad points. If you did not do this, that's your problem. It should be noted that the 2m kit comes with an addendum that states quite plainly that the 2m kit is prone to intermod, and provides alternate component values for the front-end filter that will tighten things up. I'm not sympathetic at all to the whining about wide front-ends' since this whining almost always comes from the same people that want DC-to-daylight coverage.

One thing about the Ramsey kit that does interest me is the PLL design. It appears to be able to lock up quickly after large frequency shifts. I'm curious to see if this can be exploited to run frequency-hopping spread spectrum. Not being an RF guru I might well be on drugs, but that's another reason why I bought a kit - there is enough room (and design documentation) in the kit that I can get my fat fingers in there and try out my ideas.

Has anyone considered that perhaps the requirements for obtaining an
Amateur Radio license should be upgraded to the point where people cannot
obtain a license until such time as they are aware of these problems?

The current practice (in Canada, anyway) of granting a license to anyone
who can spell "Ohm's Law" correctly two times out of three might be a lot
more at fault than John Ramsey's circuit designs.

Some of the local hams in this area have mounted plastic Owls atop the antenna
and tuned to compensate (if and when necessary). It seems to keep the real
feathered fiends at bay.

I didn't say that Ramsay should include microphones, speakers or boxes,
just that pegging the kits as existing ONLY for the thrill of
construction and not to produce a useable radio.

If this is the case, shouldn't Ramsay's ads lead off with the following
words in big letters:

DO NOT USE THIS AS YOUR PRIMARY RADIO. ONLY PURCHASE THIS KIT IF YOU
PRIZE THE THRILL OF CONSTRUCTION FAR ABOVE ANY PRACTICAL USE OF SAID
EQUIPMENT.

On the contrary, I think Ramsay is trying to push these kits to people
who "can't afford" a pre-made Japanese radio. And that is a travesty.

+Did you remember to type the port number (the "2000" part) after the
+telnet address? The first time I tried using that callsign server, I
+got caught by the login prompts because I forgot the port number. (I
+hadn't ever used anything that needed a port number before.)
+
+Regards,
+Doug Hamilton hamilton@bix.com Ph 508-358-5715

Yes, I included 2000 and got a "no route" prompt. With 3000 I got a
"connect refused" prompt. I tried to send /PORT=2000 and 3000, and every way
I could think of. My system operators can't explain the refuse to me. Do you
think it locks out connects from outside North America? Or maybe it just
does not like me.

Shalom from Jerusalem,

By the time you read this, BPQ 4.07a (not what the subject said!) should
be available on ftp.demon.co.uk:/pub/ham

If it isn't there, try a bit later (depends on when the sys admin moves it
from the upload directory).

While I understand your (theoretical) point, as a matter of fact
several of our employees had *much better* luck with their cell
phones than with their home phones in reaching us in the first 24
hrs following the quake. One of our managers was able to stay in
touch *only* via her cell phone - she had no trouble getting a dial
tone on the cell system, while her home phone had a several minute
wait for a dial tone, and then usually got an "all circuits busy"
msg after dialing.

The Oregon State University Amateur Radio Club has over 4800 tubes for sale. They are of varying types and quantities. I have a full inventory list available through my mailbox. Simply send E-mail to my E-mail address listed below with the subject "osutubes" and you'll get the list. If you want to talk about the tubes, DON'T use that subject, as I won't get the mail.

Our current offer for the tubes is $4250 + Shipping. We are not going to sell ANY of the tubes separate from the lot.

Ronnie - since you appear to be at Camp Zama, see if you can contact Roland Cowan there. He is an accredited VE and is one of the most helpful hams I've met. His callsigns are: WF4P and 7J1AKI. He's very active on both Internet (I'll find his address and advise by separate e-mail) and packet radio [7J1AKI@7J1AKI.10.JNET1.JPN.AS]. Ask him for information on TIARA - the Tokyo Int'l Amateur Radio Association as well. They are a good group of people.

I am using the KA9Q package to impliment ax.25, KISS (maybe some more)
for the communication software for a satellite being buildt here.
The sat. (SUNSAT) is an small experimental satellite. Amateur (+packet)
radio support is one of the major tasks.

What I actually need:

-> Programmers documentation of KA9Q (if it exists - I have scanned quite
a few sites.)
-> Possibly Phil Karn's e-mail address (if he has one)

Thanx
Johan

SB DX @ ALLBBS $OPDX.144
Ohio/Penn DX Bulletin No. 144

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 144
BID: $OPDX.144
January 24, 1994
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DL7VEE & DXNL, DF4RD, CT1XX, IW2IYN, AD1C, KC1AG, NA2M, WA2ABN, N2PNG, K4CEF & Southeastern Cluster Group, ON6TT, N4VZ, N8BQJ, K8YSE and NE8Z for the following DX information.

3Y0PI, PETER I ISLAND DXPEDITION. As the countdown continues for the start of this DXpedition, here is some important information: KA6V and AA6BB, are the QSL Managers and they ask that you put "ALL" your cards into the same envelope or put all your QSO labels into one card. "DO NOT" (repeat DO NOT) mix VP8BZL and VP8BZL/MM cards with the 3Y0PI cards (send them separately). Mixing operations in the same envelope will cause a delay in processing your QSL cards. Include a SASE or SAE and enough to cover at least the return postage. The 3Y QSLs will be printed in Belgium and have the same layout as the AH1A and VP8SS I cards (folding type with colored pictures). There is room for 5 QSO's per 3Y-card. If you have more than 5 QSOs, more cards will be needed, and the cost of postage will increase (So, remember send enough to cover this!). Next week we will have more on operating frequencies and practices.

EU/EV/EW, BELARUS (NOT YET!). Bob, N4VZ, had a chat with Yuri, RC2AR, and Yuri states that Belarus will not be using its EU, EV, or EW assigned prefixes until June 1, 1994. This is surprising since most other countries have made the changeover to their new prefixes and this will add more confusion since Russia uses the "R" prefix.

FO, FRENCH POLYNESIA. Walter, DJ0FX, will be active on CW/SSB through February 19 as FO0PT. He will be using 100 watts into a vertical antenna. Activity should be on all bands including the WARC bands.

GD, ISLE OF MAN. Several stations have been active on the WARC bands and the lower bands. GD4WBY has been heard on 12 and 17 meters between 1400 and 1630z. GD4PTV has been heard on 80 meters at 0800z and GD4BEG on 160 meters between 0630 and 0730z. Steve, G4UOL, will be active until the

6th of February as GD4UOL. His activity will be mainly on CW (11 kHz up or on 3507, 10102, 18070 and 24900). QSL via the bureau or CBA.

HK0/I2RAO INFORMATION. Marco, IW2IYN, reports that the "Italian DX Bulletin" states, "operations by I2RAO from Gorgola Island is considered as Colombia for DXCC, and the previous from Malpelo should really count as Malpelo".

PJ2, NETHERLANDS ANTILLES. Seppo, OH1VR, will be active from Curacao as PJ2/OH1VR from January 26 through February 2nd. Seppo is a contester and it is likely that he will be active in the CQ WW 160 Meter CW Contest next weekend.

S2, BANGLADESH. Eric, S21ZG, has been active almost daily on 80 meters (3651-3653 kHz) at 1145-1215z and again around 0000z.

V2, ANTIGUA. John, AA2LW, will be traveling to V2-land the last week of Jaunary. He will be there through the first part of February (around 10 days). John is actually there on business, but in his spare time he plans to be active on 40-10 meters SSB (his favorite band is 17 meters). QSL to CBA.

V4, ST. CHRISTOPHER/NEVIS. Mike, W9NSZ, will be active as V47NS from January 28th thru February 2nd. QSL to CBA.

VP2, ANGUILLA. Jim/KK3K, Don/WB6LYI, Mark/KC6XC, Tom/KI4ZN, Howard/W9BVD, Norm/KF7IK, James/AF9A and Wayne/AI9Q (members of the Lambda Amateur Radio Club, LARC) will be active from March 5-10. They plan to be active on multi-band and multi-mode HF, and OSCAR-13 Mode B and Mode S. They claim this may be the first OSCAR-13 Mode S DXpedition. QSL for all operators is direct to their CBA.

VP5, TURKS & CAICOS ISLANDS. Tom/K2TD, John/N2VW and Mike/WB2YOF will be active now through part of February. The group will be using /VP5 and their own callsigns. No details of their activities were reported, but listen for instructions on where to QSL.

VP8, ANTARCTICA. Brian, VP8CFM, has been assigned as Base Commander at the British Antarctic Survey Base. He will be there for 14 months and will be active as either VP8HAL or his own call VP8CFM. QSL via GM4KLO.

VR6BB/VR6JJ DXPEDITION SUMMARY. Here is information about this operation's QSO totals. They made 35025 QSOs (VR6BB - 23311 / VR6JJ - 11714). Here is just a few of their totals by bands: 683 QSOs on 160 meters, 1291 QSOs on 80 meters, 23 QSOs on 75 meters, 2698 QSOs on 40 meters and 538 QSOs on 6 meters.

XE/XF1, MEXICO. Rick, NE8Z, will be operating from Puerto Vallarta, Mexico, as XE1/NI8Z from February 13-20. Activities will be on 160-10 meters (including the WARC bands) and the ARRL CW DX Contest. Frequencies: CW - 5 and 25 kHz up from band edge / SSB - Various. SPECIAL IOTA NOTE: Rick is planning to be active from Islas Marietas (NA-189) and Islas Los Arcos Mismaloya (IOTA unknown). Specific dates are unknown at this time,

but activity will be on CW (21005 and 14005 kHz) and SSB (21260 and 14260 kHz). Rick also mentions that he is required to take along a local Mexican amateur to these islands. His goal is to spend time on the WARC bands and 80/40 meters. QSL via K8LJG.

ZS0, PENGUIN ISLANDS. This may possibly be the last ZS0 operation. Ian, ZS9A, reports that Baldur, DJ6SI, is attempting to mount a trip to the Penguin Islands sometime around Feb 24th. The RSA will turn over both Walvis Bay and the Penguin Islands to Namibia at the end of February. No other further details are available at this time.

DAYTON DX DINNER ANNOUNCEMENT. The Southwest Ohio DX Association is pleased to announce the Ninth Annual DX Dinner which will be held on Friday, April 29th, 1994, at the Stouffer Center Plaza Hotel. There will be a cash bar at 6:30 with dinner at 7:15. Tickets must be purchased in advance, and are available from Scott Lehman, N9AG, PO Box 803, Greenville OH 45331. Tickets will be $27.00. Please make your check payable to SWODXA, and send an SASE for ticket return. Seating will be limited, so please order early. If you wish to sit as a group, it would be appreciated if you order as a group. All seats will be reserved. For further information, contact Scott Lehman, N9AG, at (513) 548-6230 or Steve Bolia, N8BJQ, at (513) 429-9954 voice/fax.

KEEP THOSE BALLOTS COMING! (Only a 1 weeks to go!) Ballots for the Third Annual OPDX/NODXA DX Survey can be found in OPDX.137. Ballots can be sent to the following packet and online addresses listed below.

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and the FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

OPDX/NODXA 1993 DX Survey

THE THIRD ANNUAL OPDX/NODXA DX SURVEY.
Here is your chance to be counted. Deadline will be January 31, 1994,
with results in February. The questions of the survey will deal with:

1) The DXer of the year. This is a DXer who you thought was outstanding
in operating and handling the pile-ups from their DXpedition.
2) DXpedition of the Year (Group and Indivdual). Choose the best and most
well organized DXpedition that met the needs of the DX community.
3) The 30 Most Wanted Countries. Choose your 30 most wanted countries.
4) OPTION: Your personal comments about DXing in 1993.

Please use the ballot below. Votes will only be accepted in the
following format below.

```
---------------------------------------------------------------------
Your | DXer of the Year| DXpedition of the| DXpedition of the
Callsign | (Person) | Year by a person | Year by a group
and QTH | | |

I'm curious, Lyndon, what kind of test equipment did you use to check
out the radios after you assembled them? How did the assembly go?

STS-60 ASTRONAUTS GET CALL SIGNS

HR AMSAT NEWS SERVICE BULLETIN 022.01 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 22, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-022.01

STS-60 ASTRONAUTS ISSUED HAM CALL SIGNS

Astronauts Charles F. Bolden, Jr. of Columbia, South Carolina and Ronald M. Sega of Seabrook, Texas, have been issued amateur radio call signs in preparation for their joint U.S.-Russia science mission. The Spacehab science objectives are primarily micro-gravity oriented with emphasis on materials and life science. Bolden (KE4IQB) is commander of the space shuttle Discovery (OV-103) due for lift off on February 3, 1994, at 12:10 UTC from Cape Kennedy. Sega (now KC5ETH) is the second of four Mission Specialists. They plan to contact several schools as part of the SAREX program - including one in Russia. The flight of STS-60 represents an historic first, the first of several joint U.S.-Russian Space Shuttle flights planned in preparation for the development of the international Space Station. Veteran cosmonaut Sergei Krikalev (U5MIR) was chosen to be the first Russian to fly on the U.S. Space Shuttle. During the 8 day flight, Cosmonaut Krikalev will support the science operations on the Space Shuttle as Mission Specialist 4. Last year, Sergei attended the Dallas Ham-Com convention and said he would try to qualify for a U.S. license - but his training duties have prevented him from doing so. Since no reciprocal operating privileges exist between Russia and the United States, Sergei will operate amateur radio under Bolden's control operator authority. The possibility also exists for the first U.S. Space Shuttle to Mir Space Station (Russian astronaut-to-Russian cosmonaut) amateur radio contact! Three new Russian amateurs were launched on January 8, 1994 aboard a Soyuz rocket and docked at the MIR space station on January 10th. The new crew includes Viktor Afanasiev (commander) U9MIR, Yuri Usachev (flight engineer) R3MIR and Valerij Polyakov (doctor) U3MIR. They are using the call sign R0MIR on packet.

[The AMSAT News Service would like to thank W5YI for this bulletin item.]

STS-60 SAREX Mission Less Than Two Weeks Away

STS-60 is currently scheduled for launch on February 3, 1994 at 12:10 UTC. The flight of STS-60 represents an historic first -- the first joint U.S.-Russian Space Shuttle flight. This will be the first of several joint missions planned in preparation for the development of the international Space Station. Cosmonaut Sergei Krikalev, U5MIR, was chosen to be the first Russian to fly on the U.S. Space Shuttle. SAREX information for STS-60 including frequencies, callsigns and Keplerian elements, follows:

STS-60 Shuttle Amateur Radio Experiment (SAREX) Information Sheet

Mission: STS-60 Space Shuttle Discovery Wake Shield Facility & Spacehab-2 Mission

Launch: February 3, 1994, 12:10 UTC

Orbit: 57 degree inclination

Mission Length: 8 days (Nominal)

Amateur Radio
Operators: Charlie Bolden, KE4IQB, Ron Sega, KC5ETH,
Sergei Krikalev, U5MIR

Modes: FM Voice
Prime callsign: KE4IQB

Packet Radio
Callsign: W5RRR-1

Frequencies: All operations in split mode. Do not transmit on the downlink frequency.

Voice Freqs: Downlink: 145.55 MHz (Worldwide)
Uplinks: 144.91, 144.93, 144.95, 144.97, 144.99 MHz
(Except Europe)

144.70, 144.75, 144.80 MHz (Europe only)

Note: The crew will not favor any specific uplink frequency, so your
ability to work the crew will be the "luck of the draw."

Packet Freqs: Downlink: 145.55 MHz
Uplink:144.49 MHz

Info: Goddard Amateur Radio Club, WA3NAN, Greenbelt Maryland,
SAREX Bulletins and Shuttle Retransmissions
3860 KHz, 7185 KHz, 14,295 KHz, 21,395 KHz, 28,650 KHz and
147.45 MHz (FM)

Johnson Space Center ARC, W5RRR, Houston, Texas SAREX Bulletins
7225 KHz, 14,280 KHz, 21,395 KHz, 28,650 KHz, (SSB) and
146.64 MHz (FM)

ARRL Amateur Radio Station, W1AW, Newington, CT SAREX News
Bulletins 3990, 7290, 14,290, 18,160, 21,390, and 28,590 KHz and
147.555 MHz (FM)

Also, bulletins available on internet, via AMSAT ANS, Compuserve,
and your local PBSS.

School Group Participation: 5 school groups will participate in
SAREX with pre-scheduled direct and telebridge contacts. These
include 4 in the U.S. and one in Russia.

Prelaunch Keplerian Elements:

The following Keplerian Elements are provided by Gil Carman, WA5NOM
at the Johnson Space Center ARC:

AO-13 OPERATIONS NET SCHEDS

HR AMSAT NEWS SERVICE BULLETIN 022.05 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 22, 1994
TO ALL RADIO AMATEURS BT

BID: $ANS-022.05

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS

06-Feb-94 0530 B 057 W5IU WA5ZIB
12-Feb-94 2200 B 063 W9ODI VE2LVC
20-Feb-94 0200 B 070 WA5ZIB W5IU
28-Feb-94 0430 B 068 WB6LLO W9ODI

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

FO-20: The following is the current FO-20 operating schedule:
From January '94 thru March '94, the analog mode and the
digital mode will be on alternately for a week at a time.
ANALOG MODE:
26-JAN-94 8:20 -TO- 02-FEB-94 6:50 UTC
09-FEB-94 7:15 -TO- 16-FEB-94 7:40 UTC
23-FEB-94 8:05 -TO- 02-MAR-94 6:40 UTC
09-MAR-94 7:05 -TO- 16-MAR-94 7:30 UTC
23-MAR-94 7:52 -TO- 30-MAR-94 8:15 UTC
DIGITAL MODE: Unless otherwise noted above.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

AO-16: Operating normally. [WH6I]

LO-19: Operating normally. [WH6I]

KO-23: Up and running. Busy as usual. The most recent image files have
been blank. [WH6I]

PoSAT: G3AAJ reports than an agreement has been signed regarding the
PoSAT schedule and that amateur access to PoSAT will commence on
the 28th or 29th of January '94. [G3IOR]

KO-25: G3RWL had a personal communication from the ground controllers
stating that KO-25 will open up for amateur radio communications
in early Febuary '94. [G3IOR]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly
OSCAR status reports. If you have a favorite OSCAR which you work on a
regular basis and would like to contribute to this bulletin, please send
your observations to WD0HHU at his CompuServe address of 70524,2272, on
INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO
area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current
set of orbital elements are not generating the correct AOS/LOS times at
your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you
provide will be of value to all OSCAR enthusiasts.

>I have the following for sale or trade:
< A list of Equipment illegal for use on CB frequencies deleted. It is >
< illegal to sell this equipment for use in the CB service. Also deleted>
< are the comments of misplaced pride of it's operation on that service >

I am responding publicly about this, since the machine Dominique uses, a BBS called Canada Remote (canrem) Systems situated in Toronto Ontario Canada, is incapable of receiving inbound electronic mail.

Dominique, I have records of your previous postings indicating that your are using this equipment illegally in the CB (GMRS Class D) service (December 17 1993). I have forwarded this information, along with the previous articles where you admitted using the equipment illegally, to the Department for Science and Technology Canada, formerly Communications Canada, for them to deal with as they wish.

>The reason I am selling this, is that I am getting my HAM license soon, and
>am starting to look for a 2 meter radio. I will also trade the above setup,
>for a good 2 meter setup, make me an offer.

Not if I can help it. I will use any influence I have left as the Former Public Service Director of the Northern Alberta Radio Club, and any avenues of information transfer, such as the Packet Radio system, to ensure that people of your kind are carefully scrutinized. This will not prevent you receiving your ticket, but it may make you very uncomfortable when your past catches up with you.

For your sake, I do hope you have a very thick and resistent skin, and that you prove me wrong in my assumptions that you will provide us all a poor example of of how one disrespects the appropriate regulations of our fine Amateur Radio (HAM) service. If my assumption is correct, I do hope that the self policing action of the Amateur Radio Service is up to the task of making your life a living hell ...

Ciao, 73 de VE6MGS/Mark Salyzyn -sk-

The Full Kp Indices for 22 JAN 94 are: 3+ 2- 1+ 2- 2- 1+ 2- 2o

SYNOPSIS OF ACT
--------------------

Solar activity was low for the past 24 hours. Region 7654
(N09W21) produced one C-class flare and maintained its general
complexity in white light and H-alpha. New Region 7660
(S08E71) rotated over the east limb as bright plage that may
contain small spots. Surging was reported on the east limb near
N08 and S01 that may be signaling the return of regions that
were active last rotation.

STD: Region 7654 has been reclassified as having a delta
configuration.
```

Solar activity forecast: solar activity is expected to be
low. Isolated C-class flares are possible from Region 7654.

The geomagnetic field has been at quiet levels for
the past 24 hours.

Geophysical activity forecast: the geomagnetic field is
expected to be quiet for the next two days, becoming active
by the end of the forecast period in response to disturbed
solar wind associated with a filament disappearance on
21 Jan and a positive polarity, cross-equatorial coronal hole
near solar disk center today.

Event probabilities 24 jan-26 jan

Class M 05/05/05
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 24 jan-26 jan

A. Middle Latitudes
Active 05/05/30
Minor Storm 01/05/20
Major-Severe Storm 01/01/05

B. High Latitudes
Active 05/05/35
Minor Storm 01/05/25
Major-Severe Storm 01/01/05

HF propagation conditions were normal over all regions.
Good propagation is expected to persist over the next 48 hours,
through 25 January inclusive. High and polar latitude paths
may see minor signal degradation return on 26 January in
response to the above-mentioned filament and coronal hole
related disturbances.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the

x-rays. Flares which are not associated with x-ray signatures use the optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

Source record: 272053

Hello All,

I have a question about a possible interference problem that I may soon be experiencing.

I am considering a move from my current QTH to a new apartment. However, the apartment I'm considering is located immediately next to three transmitting towers. All three are commercial broadcast stations, one FM (102.7 MHz), one TV (Channel 10) and one AM (1240 kHz). I am currently active on 2 m, 440 MHz, and am very active on HF for shortwave listening and will soon be working the HF ham bands. I am worried that moving so close to the towers will cause problems with the performance of my equipment (noise, desensing, images, intermod, etc.)
I plan to set up some dipoles very close to the tower sites and am worried that it could ruin my enjoyment of the radio hobby if all the RF causes problems. Has anybody had any experience with this??? Is it anything to worry about??? Any experiences anyone has had (or even just bold speculations from more seasoned operators/listeners) would be greatly appreciated.

Thanks in advance,

Ron Synowicki, KG0HX

: I would like to know for sure what kind of things kick into action when
: something like that strikes.

I listened to some of the comms in Socal. What I heard reminded me very
much of what was going on here (NorCal) after our 7.1 in '89. CelTel
has had a LOT of publicity as has Internet. At the same time, I've seen
NO media mention of Amateur Radio activity down there. Sheesh!

While CelTel seems to indicate that any boob can provide comms in a disaster,
keep in mind that CelTel relies on landline and that the CelTel "HT" is
just as subject to dead battery syndrome and a 2m HT. The difference is that
the ham has (hopefully) had some training on *HOW* to handle disaster comms
and some idea of where hir next battery charge is coming from.

The experience with cell tel in '89 was that it didn't work very well when
the batteries were charge and not at all when they weren't.

>EQUIPMENT.
>On the contrary, I think Ramsay is trying to push these kits to people
>who "can't afford" a pre-made Japanese radio. And that is a travesty.
>Steven Rosenberg, KC6FYL

Heh-heh. I doubt that the thrill of construction would be attempted
unless one were reasonably certain of the outcome. One of the major
problems with the current crop of kit manufacturers is that they do
NOT offer an assembled and tested version as Heathkit did. I'm sure
every customer wonders whether the kit has something wrong that would
make the sale of the assembled unit difficult. The answer is that
the typical current product is machine assembled and that the technology
of the human assembled kits and the machine assembled Japanese radios
are radically different. Pretend that you were given all the parts,
pieces, and docs necessary to assemble your favorite mobile radio.
Lots of surface mount parts, miniature connectors, flex boards,
fragile LCD displays, and sub-min screws. I could probably assemble
it (because I've built products as bad), but suspect that the average
ham would find it impossible. So the kit manufacturer uses technology
where the builder has at least a chance of success.

There was also some question of the type of test equipment required.
If you know what you're doing, nothing more than a watts-guesser,
voltmeter, oscilloscope, and another radio is needed. Most of the
tuned circuits can be peaked instead of swept. A known weak on
the air signal will suffice for the receiver. A scanner with
a discriminator output can be used to set the transmitter frequency.
The discriminator audio (not the speaker audio) from the scanner
can be used to set the tx deviation against a known transmitter.
A sweep generator, spectrum analyzer, and a service monitor are
nice, but not necessary.

Where I see the Ramsey kits are from builders that want me to
either "clean it up" or "make it work". Usually the problem is
creative assembly, sloppy soldering, or mechanical (case) problems.
I've helped out with 3 vhf kits and know about 2 others.

There is an interesting difference between the builders and
what we used to call the "appliance operators". Every once in
a while, I drag my Cushman CE-6 service monitor to the repeater

site and call out tx frequency and deviation for everyone checking
into the local net. I've noticed that the builders tend to
take my numbers seriously while the others pretend that there
is no problem. (I have a standing offer to set the mic gain, deviation,
and tx frequency on anything a club member can drag into the office.)
An amazing number of operators literally don't care what they sound
like on the air and expect everyone to tolerate their over-deviation,
buzz, alternator whine, and distortion. Yech.

620. Icom tuning dial

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-24 13:34:04 UTC
From: jwa@tellabs.com
Message-ID: <1994Jan24.133404.29854@tellab5.tellabs.com>
Source record: 271982

I purchased an Icom 745 about two weeks ago.
After connecting it to my Kenwood PS-50 power
supply (they are compatable), I noticed, that
the VFO dial only tuned the radio about 100 Hz
per 5 revolutions when the TS button was in.

My Icom R71 moved about 10 kHz per revolution.
I came to the conclusion that there was something
wrong with the rotary sensor unit.

Icom radios use a rotary sensor to detect the rotation
of the tuning knob. The sensor is a phonolic board that
has switch contacts plated on the surface. It also has
a rotor with a metal wiper.

The wiper is made up of very fine wires that are smaller than
human hairs. The rotor moves along three plated switch tracks
on a phonolic board. One track is a common ring that connects
to the center solder tab on the board. The inner and outer
tracks have alternating squares and connect to the outer pins.
When the wiper moves along the tracks it makes and brakes
the connection between the inner and outer rings. The middle
ring connects to the + 5 volt supply.

I called Icom and the replacement cost $50.00!! I decided it
would be cheaper to repair the part. Also, in order to change
it, the front panel will have to be removed.

I tried contact cleaner and WD-40 but it didn't work. The part
is simply worn out. After connecting a scope to the outer contacts
I noticed that there was a considerable amount of contact bounce.

The outer pins of the rotary dial is connected to the micro-
processor and the inner pin connects to +5 volts. The contact
bounce is probably confusing the uP. I connected a .001
capacitor to each outer lead and the other end of each capacitor
to the inner lead. The bounce was cleaned up and tuning knob
works fine!

I saved my self $50.00 and the aggravation of removing the
radio's front panel. I'm shure, sooner or later, it will
ware out completely but I did buy some time.

The following is a QST

Californians are awakened to one of the biggest quakes in history. As usual, Amateur Radio plays a key role in health and welfare.

*****
CALIFORNIA QUAKE '94

At 4:31 am a tremor of tremendous magnitude rocked the Los Angeles basin. Almost immediately, communications in and out of

the nations second largest city became nearly impossible. Phone networks and other traditional means of communications became overloaded and useless. But, as usual, years of training resulted in amateur radio coming to the rescue in one of the most heroic stories in the history of our hobby.
"The wake up call came at 4:31 am last Monday morning and within seconds Los Angeles area hams had already swung into action. The quake was centered in the San Fernando Valley just northwest of Los Angeles. First came the work of the Public Seismic Network. A collection of hams and amateur seismologists who meet weekly on the air to compare data collected against actual seismic events. When an area event occurs, they collect felt reports on the air. And can often locate the general area of the quake within minutes by this method.
Handling this flood of calls, some under very difficult conditions, was Dorothy Darby, N6ZNC. Within the first half hour following the quake the Los Angeles RACES Organization known as the Disaster Communications Service was on the air from many of the Sheriffs stations in the area. Providing interagency communications between county sheriff, fire and the city organizations, as well as area hospitals and shelters. This reporter being the District Communications Officer for the Cresenta Valley Sheriffs Station was kept busy providing operators for that location which works with the cities of Pasadena, Glendale, and Burbank. The Glendale operators had their own set of problems, as the parking structure at the police station, where the emergency operations center is located, had collapsed destroying a number of city vehicles in the process. The hams responding to the city of San Fernando facility found it without power mains and generator power. And ended up rigging a handheld to the stations rooftop antenna. As we go to air hams are still on duty throughout the Los Angeles Basin keeping the lines of communications open. And this particular ham got reminded on more than one occasion of his phonetics, Tiny California Quake." Andy Jarema, K6TCQ.

"Santa Clarita, CA, a city that few of you had heard of until now, when this quake put it on the map. This is a community that has been cut off from the rest of Los Angeles after the collapse of the Highway 14 overpass onto Interstate 5. There was no power for twenty one hours. Telephone service, especially out of state calling is still sporadic. Except for ham radio, Santa Clarita was a community isolated from the city to the south.
I got a chance to see the devastation of the Northridge quake first hand as I drove into work on Tuesday afternoon. A trip that normally takes only 40 minutes dragged on for the better part of four and a half hours. As I sat bumper to bumper on a single lane road that parallels Interstate 5, the destructive force of this quake was evident to everywhere you looked. Highways torn apart. Twisted rebar. Mashed concrete.

But we Angrlenos seem to accept this type of natural fury as being a part of the price we have to pay to live here. So, as I inched my way into the city I also scanned the three most heavily used VHF and UHF bands in the area.
Many repeaters normally alive with chatter were silent. They were victims of being on remote mountaintops that had lost power. But other channels were alive. Repeaters whose owners had been smart enough to install battery or solar power to take over when city power failed. Each was loaded with some sort of quake related traffic. 147.705 was dedicated to working with the Red Cross and still is. 146.79 was holding forth with Santa Clarita Valley Emergency Communications. 224.52 and 224.58 were providing road closure information. 224.52 was also making its autopatch available for health and welfare calls. The number of repeaters taking part is list far to long to report here. These are just a few that I heard personally.
Later in the afternoon I used the ham station at work to scan the high frequency bands. Emergency communications nets were everywhere on 75, 40 and 20 meters. Most were associated with the ARRL'S Amateur Radio Emergency Service. Each was handling a myriad of health and welfare messages into and out of the Los Angeles Metro Area.
As we go to air, many of these nets are still on the air. Telephone service is returning to normal and many amateur radio assistance operations will soon be winding down. But the ongoing aftershocks of the Northridge quake are a constant reminder of what it costs to live here in the southland, and it's why being a ham can be vital to your very survival." Bill Pasternak, WA6ITF.
As we go to air, the California earthquake story is still emerging. We'll keep you updated in future Newsline reports.

*****
AMSAT-NA OPPOSES FCC "INSTANT LICENSING" PROPOSAL

AMSAT-North America says it does not want to see an instant ham license in the United States. The ham radio space research organization has filed comments with the FCC in opposition to the instant licensing proposal contained in a Notice of Proposed Rule Making, PR Docket 93.267.
Under the FCC's proposal, unlicensed persons who pass an amateur license examination for the first time would immediately be permitted to operate for up to 120 days. This, using self-assigned call signs, while waiting for their licenses to arrive.
But in its opposition filing, AMSAT cited the potential for abuse by persons who have no intention of taking a ham radio test and want to be able to bootleg without being noticed. It also says that it will be impossible to verify the self-assigned calls since they would not be registered in any data base.
AMSAT very strongly believes that the guaranteed anonymity of a self-assigned call sign system would multiply the potential for

interference by unlicensed persons with amateur radio operation. This the organization says is particularly relevant to the Amateur satellite service because the 2-meter, 10-meter and 70-cm bands, which presently contain the most popular satellite uplinks and downlinks, are also among the most likely to be affected by such interference. They say that the international nature of ham radio satellite operation means that problems could be caused for amateurs, and governmental authorities, in other countries as well as in the United States.
As an alternative to instant licensing, AMSAT urges the FCC to pursue the use of electronic filing and processing of amateur license applications. This is the same position that has been taken by the American Radio Relay League.

*****
ARRL BOARD MEETS

The American Radio Relay League's Board of Directors is holding its first annual meeting of 1994 in a very chilly Hartford, Connecticut as this newscast is going to air. The board is expected to take action on a number of important matters including the FCC proposal for a vanity call sign assignment system. Tune into Newsline for a full report on ARRL board actions next week.

*****
VANITY CALL DOCKET

The text of the NPRM in Personal Radio Docket 93-305, dealing with the Commission's proposed Vanity Call Sign program, is available electronically on America Online, Compuserve, Genie, BIX and the National Video Network. On most of these services the file is named vanity with a possible file extension designator attached.
The same information is also available over Internet from the ARRL information file server. To obtain it, simply send a message over Internet to infoarrl.org that says only send FCC-93-305. That's infoarrl.org and the message must only read SEND FCC-93-305.
The file is also available for downloading from the ARRL bulletin board at 203-666-0578 with the file name vanity. It will be printed in February issue of QST magazine.

*****
STROKE CW

When a ham in Fargo, North Dakota suffered a stroke, he lost almost all ability to communicate. His voice was gone, and he was immobilized. But he could tap out morse code with his finger and that gave him hope. It became the job of Paul Linnell, WQ0M to make known the thoughts and needs of Kurt Hall, W0AZV.
"The first time I was up to see him we tried communicating by

having Kurt tap out CW on my hand and on my arm and also by trying to squeeze my hand. Because he was so weak, it was very difficult to make a whole lot of sense out of the CW that he sending, but he did let us know that he could communicate.
So my second trip up I brought along a straight key and a little oscillator. I knew we were in for a problem when Kurt, when he got a hold of the key wanted to move it sideways. I then thought he was used to a bug. He immediately sent out the word bug on the straight key so I knew we were going to have some problems. Kurt is right handed and here he was laying in the hospital bed tying to send with his left hand. Also being very weak from the stroke and he was still able to send my call and his call. And even when I left that day sent 73 so when knew he was able to communicate." Paul Linnel, WQ0M.
Newsline joins with the amateur radio community of Fargo, North Dakota a full and speedy recovery.

*****
ISRAEL ACCEPTS CEPT LICENSE

From overseas, word that Israel has joined the move toward a world-wide universal ham radio license. IK1PHC reports that the Israeli Ministry of Post and Telecommunications has accepted CEPT recommendation TR 61-01. This means that any ham who holds a license in any nation that is a signatory to the CEPT agreement can freely operate an amateur station in Israel without asking for a reciprocal permit. No effective date of the change has been announced.

*****
UK SCANNER STING

For the second time in less than a year, authorities in the United Kingdom have again tuned the tables on scanner enthusiasts who eavesdrop on emergency service radio channels. This, by issuing a false distress call and then arresting those who showed up on the scene.
As 1993 drew to a close South Yorkshire police launched the undercover sting after finding evidence that criminals were cashing in on information that they intercepted over the airwaves. As they did last spring, police dispatchers broadcast a phony report that aliens were invading earth and had been spotted in a nearby town. Yes, aliens, as in little green men from Mars, and the like.
Anyhow, reports are that several people who showed up at the address given in the bulletin. They were arrested at the scene and charged with acting illegally on information broadcast in an official police radio channel.
Under British law it is not illegal for scanner buffs to eavesdrop on emergency communications. It is against the law to take any action based on any information that might be heard.

A similar sting last year in central London netted more than a dozen scanner addicts who showed up at the site of another supposedly downed alien spaceship. All were forced to pay heavy fines and a few of them actually did jail time.

*****
AMSAT AUSTRIA TO MEET

The first ever meeting of AMSAT-Austria will take place Saturday, April 16th at the Technical High School of Electronic and Telecommunication in Innsbruck. The main goals of the gathering are to present papers about basic amateur satellite technology along with seminar sessions dealing with modes-s operation, analysis of telemetry and other assorted topics. The preliminary list of lecturers includes I2KBD, ON6UG, DG2CV, OE1VKW and OE1WDC. All satellite users are welcome to attend this one-day meeting. For further information you can contact OE7FTJ at his callbook address.

*****
SUPERBALL RISES, THEN FALLS

Superball 94, the Utah balloon carrying amateur radio telemetry and an amateur television camera had a life of about three hours. The launch of Superball took place Friday, January 7th, at 16:26 UTC. The balloon initially headed northeast as expected. Telemetry was copied on both 2 and 15 meters, and ATV sent back video of the balloon.
But then Superball began to change course as it came out of the Troposphere. At about 18:04 UTC the balloon unexpectedly burst. A quick drop in the differential pressure from 1.11 to 1.03 was one of the first clues that something had changed radically. Hams in eastern Utah actually watched the rupture on ATV and later saw the parachute deploy. Telemetry on 15 meters was copied in Ohio with an signal report of 579 after the package came to rest.
The landing site is in Utah's Uinta Mountains in the neighborhood of Wolf Creek Summit, a 9500-foot pass. Plans are to locate and retrieve the payload with the help of snowmobiles and the Wasatch County Search and Rescue Team as weather permits.

*****
LA BEACON OUT

In DX, several sources report that the LA7DFA beacon has not been active from Jan Mayen since last April. LA7DFA himself says that he is looking for a rig to install permanently as beacon transceiver at the club station. He says that they also need a linear and a rugged yagi for the bad weather. LA7DFA plans to return to there in April 94 and hopes to have this equipment to take with him.

*****
GHANA

Also, XT2BW is now active from Burkina Faso but will be leaving at the end of January to spend a few months on vacation with his family in Ghana. He says that he will apply for a licence and will be active when time permits. QSL him via WB2YQH.

*****
GORDO

Famed ham radio instructor Gordon West, WB6NOA, says that he is now available to speak at your club meeting, hamfest, banquet or what have you. Gordo says that he has been able to rearrange his hectic personal appearance schedule so as to permit him to accept even more invitations from yacht clubs, ham radio clubs, SWL groups and other personal radio organizations.
West says that he requires a minimum of 90 days lead time for such appearances, and has talks available on a wide variety of subjects including Tropo Ducting, an Introduction to Radio Waves using laser light technology to demonstrate reflection and refraction, a presentation on the Global Positioning System, plus other interesting seminar sessions far to numerous to mention here. For more information on these interesting Gordon West, WB6NOA seminars and talks, contact Gordo at 2414 College Drive, Costa Mesa, CA 92626.

*****
ORIENTEERING

Amateur radio will play a major role in a national contest taking place in central Alabama.
Hams are heading to the hills, literally. It's their way of helping during a championship orienteering meet taking place in Alambama's largest State Park.
"Basically orienteering is a sport involving following a course marked on a map through the forest. And whoever completes the course the fastest wins." Tom Lamb, N4OAJ.
Tom is counting on at least a dozen hams during the weekend of January 22nd. Contest checkin points are spreadout over a large area inside the park. With so many stations, so far apart, Lamb knows how valuable amateur radio will be to the events success.
"With courses spreading out through the forest, the longest course is about ten kilometers long, that is about six miles. We have a got a lot of people scattered in far places. So one of the ways that amateur radio ties in is helping us to organize much the way that a road race is organized. But a road race is normally is tied around a road so that things are planned closer together. We are a lot more spreadout. So amateur radio is going to help us organize the different areas like the start/finish, results and those sorts of things." Tom Lamb, N4OAJ.

As many as 200 participants from across the nation are expected for the orienteering championships. Lamb expects the event to run smoothly, thanks in part to the contributions of amateur radio operators.
The hams will be helping not just with routine communications, but with any emergencies that come up, as well.

Of course.

They are also required to own a spectrum analyzer, or to know where
to get access to one.

And how to use it.

And of course, our no-code techs understand clearly that they can't
trust a manufacturer to produce a design that won't get them in
trouble.

Gee, Lyndon, I'm overwhelmed by your sympathy for a kid who
sees an inexpensive VHF/UHF rig and puts it on the air.

>who "can't afford" a pre-made Japanese radio. And that is a travesty.

Steven has hit it on the head. As hams, we have for years said "can't afford a commercial rig? Home-brew or build a simple kit." Then QST and all the other magazines which bang this drum (which quite handily fills up magazine pages with circuits that few ever build) reap big advertising dollars from kit companies.

We, as a hobby, actively encourage newcomers to try these things out.

As a hobby which has a tradition of mentoring ("elmering"), we are doing the Right Thing(TM) when we identify something like a Ramsey kit which is apt to blow a new ham's radio budget out the window while discouraging him or her, and leaving him without a working rig. I'd much rather see a Novice/Tech find an old but serviceable IC-2 (and maybe put the Ramsey 'brick' on it) than have him or her get their hopes up on the FX- kits, only to be disappointed.

I fell into this as a newcomer. I bought a Heath HR10-B and found out that construction was a LOT harder than thinking about it. And for the price, I *could* have found a used, solid, working receiver and saved much grief. I still would have done some construction, (QRP transmitter, Xtal calibrator, etc.) but would have initially tackled less imposing projects.

Keep in mind, this was with a Heathkit, which was absolutely the best. I think all of us who knew Heath know that Ramsey is no Heath.

Greg

624. Callsign Servers

Newsgroup: rec.radio.amateur.misc

Source record: 272067

The recently mentioned alternatives to the Buffalo callsign server are of no particular use.

mudgate.imsa.edu 2000 just connects you thru to Buffalo, so why make two hops.

plan9.njit.edu 2000 has been shut down and users are directed to Buffalo.

It appears that the server in Buffalo is really the only one there is.

625. MFJ's 20m SSB Travel Radio: No RIT?!

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-24 16:00:06 UTC
From: andy@clark.net
Message-ID: <2i0ra6$2na@clarknet.clark.net>
Source record: 272068

I'm looking at MFJ's new 20m SSB "Travel Radio" (TM) in their 1994 catalog. Nice compact unit, running 12 watts, for only $219 (not a kit). For a few more dollars, you can buy a plug-in CW adapter. Looks neat, if QRP is your bag.

But, where's the RIT?? How can you work SSB/CW without an RIT? Am I missing something here? No RIT control is visible in the photo, nor is there mention of one. Even their QRP CW rigs have an RIT, and so does every other QRP kit on the market.

How very strange, indeed...

630. Omni VI/ FT990 comparisons

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-24 18:04:45 UTC
From: milewski@oregon.uoregon.edu
Message-ID: <milewski-240194100218@fp2-st-affairs-11.uoregon.edu>
Source record: 272071

In a recent posting, I mentioned that purchased an Omni VI within the last month. Since that posting, several hams have replied asking for my opinions of the radio.

One of those hams was asking for my comparison of the Omni VI with the FT-990 since he was contemplating the purchase of one or the other rigs.

To help him and others who might be in the same quandry, has anyone performed any side by side comparisons or have direct experience with each radio?

If so, please post your likes/dislikes about each.

Thanks,
Steve

632. SWR meters

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-24 18:23:59 UTC
From: doc@webrider.central.sun.com
Message-ID: <2i13nvINNfl9@cronkite.Central.Sun.COM>
Source record: 272074

Greetings -

I'm curious as to my options on getting an SWR meter. I've naturally heard much about the Bird meter, but that's a pretty expensive choice.

I'm interested in feedback on other, less expensive models. My usage would be primarily for 50 watts or less and 2m/440, although I do have plans for getting an HF rig in the reasonably near future. Naturally I looking at the price/performance ratios. I'm definitely looking for accuracy, but am unwilling to pay several hundred dollars more if the difference is vanishingly small.

Many thanks for any insights,

73

Steve

>question; if it doesn't say they're guarenteed, they aren't.

My statement really meant "they're built to specified tolerances,
and they're adjusted to specified tolerances". However, manufacturing
costs can be kept down considerably if you manufacture something in
such a manner as to eliminate the requirement for adjustment after
manufacture. Certainly an Icom HF radio needs to be aligned when it
is built; however, the trend has been towards designing things with
components specified for values and tolerance consistent enough to
obviate alignment. Using a ceramic or crystal resonator for the
quadrature FM detector circuit rather than a tunable coil is an
example of this.

I still tend to question the assertion that comms gear is
built without alignment and the specs can change as a result
of a poorly working radio. The manufacturer may change specs,
but not because of production line variation. If you buy the
service manual for any modern two-way radio, there is invariably
an alignment section. Granted, these sections are getting shorter
as radios are designed to obviate alignment *and* perform well,
but I don't believe that no functional check/alignment takes
place. Maybe we ought to ask Icom, Kenwood, Yahoo, etc.

My real point is that the manufacturing and components are
highly consistent in commercial products, and that alignment
is done on standardized test jigs. This was in response to
a discussion about Ramsey kits where I was suggesting that Ramsey
kits need to be "alignable" given the variation of components
and 'manufacturing' (i.e. kit building technique).

: (except DSP I understand) can ring pretty badly.

Even analog filters can be designed for low ringing. The problem is that most crystal IF filters, and some audio analog filters, are designed for a "flat-top" response, which tends to aggravate the ringing problem.

DSP/digital bandpass filters have ringing as well, although it is easier to control than with analog filters. You should be able to do 100 Hz or so bandwidth using either analog or digital techniques with negligible audible ringing. Any narrower than that, and you will be limited by the stability and tuning rate of the HF transceiver anyway.

: What should the audio filter frequency (and phase response) look like
: to avoid ringing. A high-Q single stage bandpass sounds horrible, but
: how does a filter with flat passband (eg. Butterworth or elliptic)
: sound like or is it really required to use Bessel-response in order
: to get rid of the hollow sound produced by noise peaks.

Another name for ringing is "pulse response" since CW dots and dashes are really pulses of RF. The filter shape with best pulse response for a given bandwidth is, I believe, Gaussian. This is closely approximated by a series of cascaded single-resonator filters, all tuned to the same frequency. Examples of a "resonator" would be an LC tuned circuit, a quartz crystal, or a tuned cavity.

You get a better shape factor by using more resonators. (Shape factor is the ratio of the high-attenuation bandwidth [e.g. 30 dB] to the low-attenuation bandwidth [e.g. 3 dB].) For example, a single resonator with a 100-Hz bandwidth would have about the same bandwidth (and pulse response) as a cascade of three 200-Hz filters, but the shape factor would be much better with the three resonators (in this case, 32:1 for one resonator, 3:1 for three resonators.)

Butterworth and Chebyshev filters have flatter passbands and better shape factors, but at the expense of poorer pulse response (ringing).

: and am very active on HF for shortwave listening and will soon be working
: the HF ham bands.

Yup, you likely will have some problems. You will need a high-pass
filter between your HF antenna(s) and transceiver. Assuming you don't
want to operate the 160 meter band (1.8 MHz), it shouldn't be hard to
design a filter that cuts off 1240 kHz and passes above 3.5 MHz. Check
out any recent edition of the ARRL Handbook for cookbook filter design tables.

Even with the high-pass filter, you probably will have trouble with
harmonics from the AM station. 3 x 1240 = 3720 kHz, which will probably
wipe out the top of the 80 meter novice band. For your shortwave listening,
you will probably hear a distorted version of the AM station every 1240 kHz
throughout the HF spectrum.

For 2 meters and 440 MHz, you probably want bandpass filters. I bet someone
makes these ready-made -- check out the ads in the ham magazines. Otherwise,
it shouldn't be too hard to build a strip-line filter from designs in
the VHF Manual or the RF Interference handbook.

Is there anyone out there who has any experience with the Eimac 3CX1200D7 ? This tube is an improved design over the 3CX1200A7. The 3CX1200A7 is not recommended by EIMAC for new designs. This is due to a tendency to parasitics and is partially caused by the tube filament structure and the high feedthru capacitance. Any amplifier builders out there can comment ?

do anything in your lifetime that you are not regretful of? Are you that
perfect? I only know of one man that was that perfect..and he is not
holding our mistakes against us. Be a little more tolerant Mark, perhaps
this poor soul can be re-educated into a useful individual. You sure are a
poor example of Ham Radio Brotherhood! A P/R spokesman for ham radio you
are not, and you sure do not represent my sentiments...and I can assure you
I worked just as hard as you did for my ham privledges ..and I hold '
em just as high...but give it a break, Mark.

OK, got my tech and passed the general theory and will try to go get
5 wpm next week.

How does the test go? is it the standard one-sided QSO I've been hearing
on MORSE TUTOR? Is there a standard format, do do the VE's get to
do it hoiwever they want?

You didn't say if the plugs you put in have a built in resistor. It
sounds as if the plugs you removed did have the resistors built in.
You can usually tell if the plugs are resistive if they have an 'R'
somewhere in the part number. Your vehicle has resistive wiring but
that alone is obviously not enough!

==========

VOA AND WORLDNET TV TO PROVIDE SIX-LANGUAGE, LIVE COVERAGE OF PRESIDENT CLINTON'S STATE OF THE UNION ADDRESS

*
*

Washington, D.C., Jan. 24 -- The Voice of America and WORLDNET TV will provide live, simultaneous coverage in six languages of President Clinton's annual "State of the Union" address beginning at 0200 UTC, Wednesday, Jan. 26.

The Voice of America will be providing worldwide coverage of the speech and the response by the opposition Republican Party. The shortwave frequencies for the worldwide English broadcast are listed below. VOA will also be providing regional shortwave coverage of the speech in Russian, Portuguese and Spanish.

WORLDNET TV will offer live, simultaneous translations of the speech in Arabic, French, Portuguese, Spanish and English. WORLDNET TV can be seen via satellite outside of the United States. Interested viewers should contact their local cable company or United States consulate for viewing information.

The Voice of America and WORLDNET TV are the radio and television international broadcasting services of the U.S. Information Agency. VOA broadcasts 1,100 hours of programming in more than 40 languages to a weekly audience estimated in the hundreds of millions.

Steve Bunis SE Southwest Chicago (doc@webrider.central.sun.com) wrote:
: Greetings -

: I'm curious as to my options on getting an SWR meter. I've
: naturally heard much about the Bird meter, but that's a pretty
: expensive choice.

I would not exactly call the Bird meter a SWR meter, although one can obtain the SWR from the readings. The Bird meter is an in-line wattmeter. reads the power to and fro, and with this information and a little work with the bamboo sticks one can come up with the SWR.

If you want something that is approxiamate, and will give you readings in SWR, why not buy one of the cheapo RS swr meters? Or one of the other cheapo swr meters handled by HRO, AES and the like? They generally are quite satisfactory. Now on the other hand if you want to know your power out....

The last time I was in Yellowstone (7 years ago), there was
no repeater operating in the park. I did contact a person on
a fire tower on 146.52. In fact, I used 146.52 simplex most of
the time I was in the park. You might try that frequency when you
get there.

I'm looking for a program to make up tests for the no-code tech test
(novice + tech q-pool) to run on an IBM clone.

Autoexam does this, but the only version I've found (SIMTEL mirrors)
still has the old question pool. I HAVE the new question pool as text,
but it is no simple matter fudging it for Autoexam.

Oh, yeah, I need it in about 2 hours! Well, I can give it to the students
next week, but I'd like to have it for tonight.

Thanks,

Jud

From an eirlier posting:

>KD6OY Garry Shandling, comedian

According to the callbook Garry Shandling holds an Advanced Class
ticket. I once saw him interviewed, and he mentioned that he was an
electrical engineering student. He never metioned if he graduated, but I
assume he gave up college when his career took off.

Yeah Mark! I'm glad to see someone take the initiative to help out the government in getting these people fined and put in jail if necessary. There will be many armchair-lawyers out there who will accuse you of playing ham cop (or whatever Dana called me) who are willing to sit back and complain without lifting a finger to do anything, so be prepared to get a 3rd degree burn.

This is ``self-policing'' in its finest! [Meaning that we police ``ourselves'', not just ``myself'']

Could someone please mail me the ascii version of the instructions
to convert a GE MASTR II mobile to repeater use? I was able to find
the Micor instructions, but I have just run into a boatload of MASTR II's
and I can't find the mod anywhere.

I'll post it if need be.

Thanks..

Sean

TEXTS

ALLNET COMMUNICATIONS SERVICES, INC. V. CENTRAL TELEPHONE COMPANY OF OHIO, AND CENTRAL TELEPHONE COMPANY OF NEVADA. Granted joint motion and dismissed with prejudice Allnet's complaint against Central Telephone-Ohio and Central Telephone-Nevada seeking damages resulting from alleged violations of the Commission's rate of return prescription for the period January 1, 1989 through December 31, 1990. (By Order [DA 94-49] adopted January 11 by the Chief, Formal Complaints and Investigations Branch, Common Carrier Bureau)

COMSAT CORPORATION. Authorized Comsat to participate in a program involving construction of certain additional INTELSAT satellites, and provisions of authorized services. (By MOO&A [DA 94-37] adopted January 7 by the Acting Chief, Common Carrier Bureau)

INTERNATIONAL TELECHARGE, INC. (ITI)V. PACIFIC TELESIS GROUP. Granted joint motion and dismissed with prejudice ITI's complaint against Pacific Telesis seeking to recover damages from alleged violations of the Commission's rules in connection with Pacific's computation and assessment of terminating carrier common line charges. (By Order [DA 94-47] adopted January 10 by the Chief, Formal Complaints and Investigations)

AT&T COMMUNICATIONS. Denied Tel-Save Inc.'s petition to reject, or to suspend and investigate, AT&T's Tariff FCC No. 12, Transmittal No. 6162, introducing SelectCall, an AT&T long distance service that permits customers to receive direct dialed calls originated over AT&T network from subscriber-authorized telephone numbers and have those calls automatically reverse-billed to the customer without the assistance of a company operator. (By Order [DA 94-66] adopted January 21 by the Chief, Tariff Division, Common Carrier Bureau)

ONCOR COMMUNICATIONS, INC. V. PACIFIC TELESIS GROUP. Granted joint motion and dismissed with prejudice Oncor's complaint against Pacific Telesis relating to primary interexchange carrier freeze practices. (By Order [DA 94-50] adopted January 11 by the Chief, Formal Complaints and Investigations Branch)

LIGHTCOM INTERNATIONAL, INC. Authorized Lightcom to establish channels of communication between the U.S. and INTELSAT Atlantic and Pacific Ocean Region satellites for the provision of INTELSAT business service and to provide international private line service. (By O&A [DA

94-51] adopted January 4 by the Chief, International Facilities Division)

WILTEL, INC. V. THE AMERITECH OPERATING COMPANIES, ET AL. Granted joint motion and dismissed as moot WilTel's complaint against Ameritech, et al, seeking damages resulting from alleged violations of the Commission's rate of return prescription for the period January 1, 1989 through December 31, 1990. (By Order [DA 94-45] adopted January 11 by the Chief, Formal Complaints and Investigations Branch)

R & R COMMUNICATIONS, INC. Ordered R & R to forfeit $2,000 for willful violation of the Communications Act and the Commission's rules by marketing an amateur radio transceiver that had been modified to operate on non-amateur frequencies. (By Order [DA 94-40] adopted January 7 by the Chief, Field Operations Bureau)

January 24, 1994

NOTE: The Effective Sunspot Number for 23 JAN 94 was 50.0.
The Full Kp Indices for 23 JAN 94 are: 2- 2- 1o 2- 2- 1o 2- 2-

SYNOPSIS OF ACT

Solar activity was at low levels. Region 7661 (N08E37)
was numbered today. The flux has experienced a significant
increase, possibly due to Region 7661.

Solar activity forecast: solar activity is expected to be
mostly at low levels.

The geomagnetic field has been at quiet levels for
the past 24 hours.

Geophysical activity forecast: the geomagnetic field is
expected to be at unsettled to active levels, due to a coronal

hole.

Event probabilities 25 jan-27 jan

Class M 05/05/05
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 25 jan-27 jan

A. Middle Latitudes
Active 05/35/35
Minor Storm 01/25/25
Major-Severe Storm 01/10/10

B. High Latitudes
Active 05/35/35
Minor Storm 01/25/25
Major-Severe Storm 01/10/10

HF propagation conditions continued normal over all
regions. Similar conditions are expected on 25 January. A
coronal disturbance should result in minor signal degradation
for transpolar and transauroral circuits on 26 and 27 January.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

>>experience.
>
>Exactly. I picked up a pair of Ramsey's (2m, 440) to run on packet. Why?
>For one, it seemed silly to buy an all-singing all-dancing 400 memory PL
>rig just to wire down onto one frequency for packet. The Ramsey kit is
>easily interfaced to a packet modem.

I agree it doesn't make sense to put a general purpose radio on packet.
For one thing. most general purpose radios are too prone to desense
and/or intermod from other radios in the shack (I run VHF packet,
VHF and HF voice/data). I use a Motorola MCX100 for packet, I have
a Motorola Maxar-80 set up that is on loan to a high-level BBS, I
have a GE Custom MVP with GaAsFET amplifier as a backup radio.
Guess what? I spent under $60 on each radio, including buying the
manual from the manufacturer. I had the experience of tinkering
with well-built, high-performance radios. An FX-440, for example,
is de-sensed by anything transmitting below 440MHz.

>As for price, the Ramsey kit is marginally less expensive than a comparable
>single band radio WITH THE SAME FEATURES. I defy you to find a commercially
>manufactured 2m (or 440) rig, with as few features as the Ramsey, to compare
>the price to. When you do, *then* we'll argue about the relative expense of
>the Ramsey kit.

Well, I've pointed out three radios that are far superior to the
Ramsey FX-146, and I bought all of them for under the cost of one
Ramsey FX-146 and cabinet.

>I agree that the front end on the Ramsey kit is wider than it should be.
>I was aware of this from the outset. Prior to buying it, I asked around
>about it's good and bad points. If you did not do this, that's your problem.
>It should be noted that the 2m kit comes with an addendum that states
>quite plainly that the 2m kit is prone to intermod, and provides alternate
>component values for the front-end filter that will tighten things up. I'm
>not sympathetic at all to the whining about wide front-ends' since this
>whining almost always comes from the same people that want DC-to-daylight

>coverage.

The UHF kit has no warning that normal component tolerances can render
the radio deaf; the one I sampled requires 50mV for a useful quieting
at 446Mhz.

>One thing about the Ramsey kit that does interest me is the PLL design. It
>appears to be able to lock up quickly after large frequency shifts. I'm
>curious to see if this can be exploited to run frequency-hopping spread
>spectrum. Not being an RF guru I might well be on drugs, but that's another
>reason why I bought a kit - there is enough room (and design documentation)
>in the kit that I can get my fat fingers in there and try out my ideas.

The method to generate useful SS is either by DDS frequency hopping
or I/Q modulated carrier. PLL approach to SS is doomed to relatively
few hops/second and/or considerable "bounce" in the desired frequency.

>It's a shame that the Amateur Experimental Service has turned into the
>Amateur Appliance Service.

It is a shame amateurs won't take advantage of readily available
high-quality surplus to use as a platform for experimentation and spend
considerable effort defending junk radios that don't even come up to the
performance standards of a Part 15 cordlesst telephone. :-)

C'mon, another way to deal with component and construction variation
is to provide tune-up instructions and methods to compensate for
the tolerances. Ramsey does neither.

>6. The Ramsey kits are not state of the art, high quality,

Yeah, if people just built them for the experience, that would be
one thing. But people get the impression they can put those radios
on the air and use them like a normal radio, too.

From: Roger.Vargo@f943.n102.z1.fidonet.org
Message-ID: <759497522.AA03726@mcws.fidonet.org>
Source record: 271954

Excuse my butting in here...

The cellular "problem" after the quake was two fold. First, there was the general system overload when everyone grabbed their cell phone to either report an earthquake or let a loved one know they were ok.

Secondly, some cell sites were affected by the loss of power. Driving around I saw several sites later in the day that were conected to portable generators.

The problem of communications was also compounded by the overload and partial shut down of the land line telephone system.

I didn't even bother to fire up the packet system last week during the emergency. The frequencies around here are normally crowded and I didn't want to make matters worse. Just monitoring the voice traffic over some of the major repeaters was enough!

I don't have any real backup for my packet system. My radio is a handheld connected to an outside antenna, so it will run off it's own battery. My TNC will work off a battery since it is 12-v but I usually just use it on a converter. The big problem in an emergency would be my computer which is like a boat anchor on the AC line. When I get a laptop I'll consider myself portable (or at least transportable).

73/Roger, N6YDT at the east end of the San Fernando Valley.

658. RFD: talk.politics.rush-limbaugh

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-25 06:06:17 UTC
From: cstone@husc8.harvard.edu
Message-ID: <2i2csp$dfr@scunix2.harvard.edu>
Source record: 271966

```
================================
RFD: talk.politics.rush-limbaugh
================================

This is a formal request of discussion for the creation of a Rush
Limbaugh-related newsgroup. Please direct all followups to news.groups.

PRPOSED CHARTER:

The unmoderated group talk.politics.rush-limbaugh will serve as a forum
for the discussion of issues raised by Rush Limbaugh's radio show, TV
show, books, newsletters, and other media. It will also act as a place
for Rush listeners to talk about Rush fandom such as the opening of new
Rush Rooms in various cities, methods of obtaining tickets to Rush's TV
show, Rush's appearances in public and on other TV shows, and so on.
This function, however, is likely to be secondary to the group's primary
mission of hashing out the issues of the day, and hence the group shall
be part of the talk.politics.* hierarchy.

It is *essential* to note that posters of *all* ideological stripes will
be welcome on talk.politics.rush-limbaugh. Articles critical of Rush are
to be afforded the same respect as articles in support of Rush. It is
hoped that the creation of the new group will inspire intelligent
political discussion by using Rush's thoughts as a springboard.

BACKGROUND AND RATIONALE:

On the newsgroup alt.fan.rush-limbaugh, we have been discussing the
possibility of formally incorporating the group into the talk.politics.*
or rec.arts.* hierarchy for some time now. The former was chosen largely
because political, as opposed to fandom, discussions dominate the group
now. Several people, myself among them, have argued that a rec.arts.*
placement would be better because Rush usually insists he is an entertainer
first and a pundit second. However, support for a
talk.politics.rush-limbaugh appears more widespread.

With a recent onslaught of insulting posts and namecalling by radical
conservatives and Rush-haters alike, the creation of a moderated
newsgroup has some intuitive appeal. However, in my opinion, the spirit
of free inquiry demands that the group be unmoderated. In an highly
charged ideological forum such as talk.politics.rush-limbaugh, the
potential censorship costs of moderation will prove too high.

Alt.fan.rush-limbaugh is one of the largest alt.* newsgroups, and I fully
admit that I think the high rate of traffic on alt.fan.rush-limbaugh
indicates that Rush-related subjects deserve a formal place on the usenet
hierarchy. Moreover, Rush's radio show has become increasingly accepted
```

by the mainstream, non-ideological media as of late. Rush has also exhibited far more staying power than comparable talk show hosts. It is also essential to note that many sites to not offer access to alt.* groups, and given that -- for good or ill -- Rush's popularity has soared in recent years, people from those sites deserve the opportunity to discuss Rush just as much their counterparts elsewhere. On the liberal side of the aisle, the net also offers the perfect place for Rush's thought to be subject to rigid scrutiny.

VOTES

If the proposal comes to a vote, I shall contact Ron Dippold within twenty-one days of today's date.

hello,
are there any mods for the yeasu FT416 available ?
I'm looking for:
- extendet TX (got 140MHz .. 150MHz)
- extendet RX (got 136MHz .. 176MHz)
- repeater switch on beep, 1750 Herz like the euro version has
(got the american version without that tone)
- hidden, undocumented features

Thanks for any hints

Martin

> a given bandwidth is, I believe, Gaussian.

If the typical telegraph speeds would be 60 - 150 WPM, then the shape
of typical CW-filters (250 - 700 Hz) would be very important. At typical
CW-speeds (10-20 WPM) and rise and fall times (5-10 ms) the required
bandwidth is about 100 Hz or below and thus the shape of a much wider
(analogue) CW-filter doesn't radically alter the keyed waveform.

I think that the reason for the howling sound in CW-filters is that
in high-Q filters a noise pulse at (or close to) the center of the
passband is causing an oscillation that slowly decays into the
background noise. The higher the (loaded) Q is, the longer (more cycles)
this decay takes.

> This is closely approximated
> by a series of cascaded single-resonator filters, all tuned to the same
> frequency. Examples of a "resonator" would be an LC tuned circuit, a
> quartz crystal, or a tuned cavity.

Yes, this is true for connected resonators, but you have to control the
connection between the resonators and the loaded-Q for each resonator to
get the shape you want. You can get e.g. Butterworth and Chebyshev responses
by manipulating these parameters.

However, if cascade separate individual resonators (separated by amplifying
stages or use many active filter stages) tuned to the same frequency,
the responses of individual stages add together and the resulting response
is similar to very high-Q single resonator. I cascaded 175 Hz (-3 dB) wide
audio filters, three stages was still usable, but four stages sounded
horrible. The combined response for four stages is -12 dB at the 175 Hz
bandwidth or about 70 Hz for -3 dB.

The filter was used to monitor a distant VHF-beacon and thus most of the time there was only noise in the passband causing this howling sound. I am going to stagger tune each rection to a slightly diffrent frequency to get the combined -3 dB bandwidth to 150 - 200 Hz and hope to get rid of some of this howling.

I used crystal filters in old tube receivers for many years and always thought that ringing was an inevitable result of narrow bandwidths. In fact, I though that basic information theory (Turing, Naiquist, et al.) dictated it. I used to think that an effective bandwidth of some 200-300 Hz. was about minimum and that less than that would cause so much ringing that weak signals would be lost. Then modern 250 Hz. CW filters made me realize that as little as 100 Hz. may be OK.

A few months ago I built a kit of W9GR's DSP unit, described in QST September, 1992. One of the modes it provides is a CW filter with 30 Hz. bandwidth. (Yes, I said 30 Hz!) It has a center frequency of 750 Hz. and is very effective in copying CW. To my ears, it does very little ringing, yet is usable with quite high-speed CW.

Now I doubt that the basic physical laws have been "repealed". One can question whether the passband is really as narrow as 30 Hz. I have not analyzed it on laboratory-grade instrumentation, but I have made a rough measure of bandwidth. Using my Kenwood TS940, I tuned in the carrier of a local broadcast station. With the transceiver in CW mode, I offset the tuning to get a 750 Hz. beat note, then tuned up and down, noting the frequency on the digital counter. I can verify that the 6 dB. bandwidth is something like 30 Hz. - certainly less than 50.

Can someone with a great deal more technical knowledge than I have state just what is the minimum usable bandwidth for a 10-20 WPM CW signal, and how much audible ringing is truly inescapable?

664. Power Line Interference

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-25 14:05:37 UTC
From: drs@ccd.harris.com
Message-ID: <1994Jan25.140537.16951@ccd.harris.com>
Source record: 271988

For the past 3 years I have been trying to track down some noise that appears to be coming from the power lines. I have walked around with a portable radio, driven around (for miles in all directions) in my car seeking the source. The source seems to come from one of the two power poles across the street from me.

This noise tends to show up in the Winter time or on cool or rainy Summer days. In the Summer time I might have the noise on a day that remains cloudy (therefore cooler). In the Winter time the noise also tends to also show up mostly (but not always) at night time when it is cooler. We are talking about Florida, so in the Winter time it doesnt normally get that cold. Now here is the weird part: The noise has a cyclic period of about 1.5 seconds on and 1.5 seconds off. This part doesn't vary. If I have the noise, it has this period. Now there are no capacitors on the power poles around me. The pole that I suspect has a transformer on it. Can a transformer do this? How? Is there some sort of capacitor or protection circuit on these xfmrs that can do this?

Normally, I cannot determine the source (this changes). My 20 meter beam seems to tell me which pole the noise comes from, but if I walk up to the pole, with a portable radio I normally am not able to zero in on it. I have called the power company in the past to repair a problem which I was able to point them to. I am reluctant to call them on this one, even though it tears up all from 1500 khz to 21 mhz. I have heard that this sort of interference can originate miles away and be picked up by the power lines at some distant point (my house). I imagine I'll call the power company for resolution, but would like any input I can get before I do it. Please don't tell me to go beat on the pole!

A lot of operators lived without RIT. Many of the 'boat anchors' didn't
have RIT. The most recent rig not to have it was, I guess, the Heath HW-
series.

After all, if ONE station has RIT, that's more than enough.

>factors, but at the expense of poorer pulse response (ringing).

If we broaden the definition of ringing to allow for noisy signals, of
the kind encountered on the low HF bands such as 80m, then there might
be more than one source of ringing:

1. As Al described. Ringing that arises out of improper pulse
response.

2. Progressive coloration of background white noise as the filter
bandwidth is narrowed. Consider the following thought experiment:
A white noise source that produces broadband output from 300Hz to 3KHz
is fed into a fir filter. These filters have a flat phase response and
with enough stages they have impressive shape factors. Lets say that the
filter has a center frequency of 750Hz. As the filter is narrowed, a
progressively pure 750Hz tone will emerge. This tone can also make
copying a CW signal difficult.

I suppose one could easily experiment by using the filter
with signals with different Signal-to-Noise ratios.

Yeah, why do you need RIT anyway? I'm serious, when I work HF it's just another useless knob on the rig. Maybe I'm dense, but I've never managed to figure out what it's for. I hardly ever touch it. If the station you want to contact is operating normally, you just zero-beat him and that's it. The only time I can think it might be useful is if you want to contact a DX station who is operating on split transmit/receive frequencies, but then they're usually too far apart (anywhere from 3 KHz to a couple of hundred KHz) for the average +/- 2 1/2 KHz RIT control to do any d--n good. Maybe it would be good for switching in and out to tune in the one oddball in every net who can't be bothered to get any closer than somewhere in the general ballpark of the net frequency, but that's about all I can imagine. What do you use this knob for?

To All Hams World-Wide,

I spotted a reference to a FREE logging program on a conference that I monitor on USENET. I had the article published in our Club newsletter as well as mailed to over 75 Hamclubs throughout Calif., Hawaii, the East Coast!

A friend of mine sent for this program. He received his program but it isn't free. I find this sort of advertising to be deceptive and misleading. I find that $49.99 is not exactly free or did I miss something when I read the following description to SPLog.

The following text was excerpted from the post on USENET and the docs that came with SPLog!
---

* * * FREE LOGBOOK SOFTWARE * * *
^^^^^^^^^^^^^^^^^^^^^
Greetings to all.

Latest version of very popular Logging software SPLog is now available to the world at large.

For your free copy, send a formatted disk of your choice
^^^^^^^^^
(IBM format) with SASE (Foreign stamps are No Good in Canada) to:

Peter Pfeiffer
63 Beaver Cr.
Brantford, Ont.

I am considering buying a multi-sytem VCR to take to India. It must play NTSC and PAL. Is there a list of mail-order places that might stock an item such as this?

I tried J&R Music World, they list an AIWA for $380 and another for $500. B&H has some professional stuff for $1850 (too much for me).

Also, where is the FAQ for this newsgroup?

Thanks,

Navaneeth

I don't have handy at the moment where on the net you might find this, but the FCC's spectrum allocations are set forth in Part 2 of its Rules. You need Subpart B of Part 2 of Title 47 of the Code of Federal Regulations. In legalese (not that the foregoing was actually English) that is "47 C.F.R. sections 2.100 - 2.108 and it is called the "Allocation, Assignment, and Use of Radio Frequencies," more commonly called, the Table of Allocations.

I recall seeing that there is a Gopher site somewhere that is experimentally offering access to at least some portions of CFR, but unfortunately I don't have the reference handy at the moment.

Good luck.

>73, Van - W8UOF

I assume that G is an average-size letter in Morse and the
transmission is at 120 wpm (2 characters/s). G's sound is:

111011101000

where 1 corresponds to key on, and the last 3 pauses are character delmiters.
Assuming that a single sinusoid cycle has 2 items (00, 10, 01 or 00),
G has 6 transitions or cycles or Hz.
So the minimum bandwith at 120 wpm would be
2 characters/s * 6 cycles/character =12 Hz.
Multiple by 2-3 so that dots and dahs are flatter and (probably) by 2 if
you want to copy the other sideband.

The bandwith at 120 wpm is in the range of 24-72Hz, assuming no drift,
no off-tuning and well shaped signals.

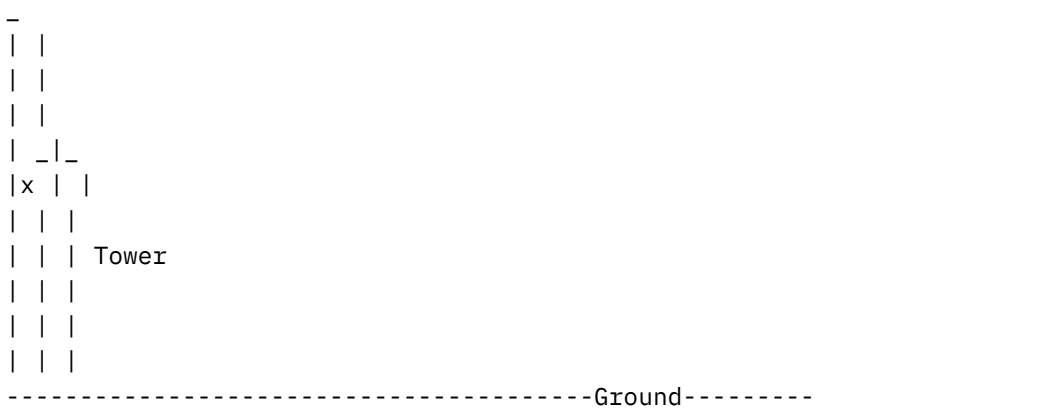
Message-ID: <CK7B0q.JH3@world.std.com>
Source record: 271978
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.misc

A friend of mine asked me this question, and I do not know the answer. If one has an antenna (say a vertical or something, as opposed to a beam) that is x feet above ground level, how does one compute the approximate coverage area of that antenna (in square miles)? For example, see the following diagram



If we assume that the distance x is, say, 200 feet and that the ground around the antenna is relatively flat, is there a way to estimate the area of coverage for that antenna?

Thanks,

/MC

I think you would do better to cascade 3 stages of 300-400 Hz bandwidth
(or 4 stages of slightly wider bandwidth.) That would give you the desired
150-200 Hz bandwidth with less ringing than if you stagger-tuned
resonators with 175 Hz bandwidth.

ASA MEMBERSHIP INFORMATION

The Electronic Journal of the Astronomical Society of the Atlantic (EJASA) is published monthly by the Astronomical Society of the Atlantic, Incorporated. The ASA is a non-profit organization dedicated to the advancement of amateur and professional astronomy and space exploration, as well as the social and educational needs of its members.

ASA membership application is open to all with an interest in astronomy and space exploration. Members receive the Journal of the ASA (the JASA is a hardcopy sent through United States Mail and is not a duplicate of this Electronic Journal) and the Astronomical League's REFLECTOR magazine. Members may also purchase discount subscriptions to ASTRONOMY and SKY & TELESCOPE magazines.

For information on membership, you may contact the Society at any of the following addresses:

Astronomical Society of the Atlantic (ASA)
P. O. Box 15038
Atlanta, Georgia 30333-9998
U.S.A.

asa@chara.gsu.edu (For ASA issues)

==========

Ultraviolet Rays

Our planet Earth's atmosphere is opaque to radiation in the ultraviolet waveband due to ozone and molecular absorption. As a result, astronomy in these wavelengths has to be carried out from above the atmosphere, preferably with artificial satellites.

The band divides rather naturally into two regions. The region 300 > lambda > 120 nanometers can be studied using techniques similar to those used in optical astronomy. At shorter wavelengths, however, it is difficult to find materials which reflect radiation at normal incidence. Rather, the incident radiation is simply absorbed by the mirror material with little or no reflection.

Perhaps the main problem for using this waveband as a detector for extraterrestrial intelligence is that at wavelengths shorter than 91.2 nm, the Lyman limit for hydrogen, interstellar gas becomes opaque, probably due to photoelectric absorption by neutral hydrogen in the Lyman continuum. This effect is particularly important for objects localized inside our Milky Way galaxy.

In spite of all these limitations, in 1974, H. Wischnia used the facilities of the Orbiting Astronomical Satellite (OAO, also called COPERNICUS) to search for ultraviolet laser pulses around the nearby stars Epsilon Eridani, Tau Ceti, and Epsilon Indi (Tarter, 1991). The observations were carried out in ultraviolet wavelengths below 0.28 micrometers.

Of particular interest in this waveband are the Lyman series of absorption lines with wavelengths of 1214 A, 1024 A, 971 A, 948 A, and 937 A (where A is Angstrom), corresponding to the various fully excited states of the hydrogen atom. The predominant line is the so-called "Lyman Alpha" of 1024 A. It is quite possible that an extraterrestrial civilization could choose to generate a signal which

may lie close to, or preferably right within, the absorption region. The background radiation of our Sun (and presumably other solar-type stars) is down by a factor of 10exp6 at Lyman Alpha wavelengths when compared with the output of visible light. Such a reduction offers a considerable improvement in the signal-to-noise ratio.

X-Rays

Elliot (1973) pointed out that X-rays are not appropriate as a means of transmitting a continuous stream of information because of their high quantum noise. As a means of sending and receiving the "first beacon signal", however, he considered that X-rays could have certain advantages. Elliot analyzed the X-ray emissions of the terrestrial nuclear explosions carried out in the early 1960s. When a nuclear weapon explodes, about seventy percent of the energy released is in the form of kilovolt X-rays. This X-ray pulse is formed in less than one microsecond. If the explosion occurs above eighty kilometers, the X-rays are not absorbed by the atmosphere and are free to propagate into space.

Other advantages of using the X-ray pulse generated by a high-altitude nuclear explosion are: (a) The pulse is short and will not be broadened or appreciably attenuated by propagation through the interstellar medium; (b) there are not stringent requirements on the receiver, since the pulse covers a broad X-ray spectrum; and (c) the X-ray flux involved is much larger than that of a solar-type star, a natural source of X-rays.

Elliot estimated the distance at which the United States "Starfish" nuclear test could be detected by our present technology of X-ray detectors. Assuming that the energy of the explosion is equivalent to 1.4 megatons and that the X-ray pulse was equally intense in all directions, he found that this explosion should be detected from a distance of d~400 Astronomical Units, about ten times the radius of Pluto's solar orbit.

Supposing that all the terrestrial nuclear powers [3] pooled their nuclear weapons stockpiles to produce a single explosion in space (E~2x10exp4 megatons). Considering that the X-ray pulse could be concentrated into a conical beam of about thirty degrees in angle with no loss of radiation, a typical terrestrial X-ray detector should be able to detect a signal from a distance of ~190 light years.

==========
3 - In 1989 the United States and the Soviet Union had almost 55,000 nuclear warheads with a combined destructive power of 15,500 megatons (Source: Bulletin of Atomic Scientist, 1990).
==========

Fabian (1977) suggested that a supercivilization (in the transition from Kardashev's Type I to Type II) could - in the same sense of the proposals by Drake and Shklovskii - drop material onto

a neutron star. This material could be impinged onto the surface at about one-third of the velocity of light. About ten percent of the rest mass energy of the matter will emerge as radiation, predominantly as X-rays if the mass flow rate exceeds ~10exp16 F gm sec-1, F being the fraction of the surface onto which matter falls.

Thus, to produce an X-ray flash as energetic as that suggested by Elliot (1973), ten tons of matter of any composition would have to be dropped onto a neutron star. According to Fabian (1977), such a flash will be broadband and almost omnidirectional, although some beaming may occur if the neutron star possesses a strong magnetic field.

The above arguments show that an object of about one kilometer in size and 10exp16 gm dropped onto a neutron star could produce an X-ray pulse (E~10exp36 ergs) strong enough to be easily detectable throughout the Milky Way galaxy. Harwit and Salpeter (1973) argue that the soft gamma-ray burst observed by Klebesadel et al (1973) may be due to comets falling onto the surface of a neutron star. If an advanced civilization could cause individual objects that might be easily found in the neutron star's neighborhood to fall onto the star in a pre-arranged pattern, this could be detected across the galaxy.

Gamma Rays

Viewing et al (1977) pointed out that an alternative method for SETI could be the detection of alien artifacts. Because most of the different models for interstellar propulsion (Mallove and Matloff, 1989) produce copious quantities of gamma rays, they proposed the search for this kind of radiation from the antimatter annihilation process. Harris (1986) showed that interstellar spacecraft as gamma-ray sources will be most easily recognized by their proper motions. Their velocities, being substantial fractions of the velocity of light, will be at least one hundred times as large as the highest velocities characteristic of normal astronomical objects. No steady gamma-ray source is known with a proper motion as large as one degree per year.

For spacecraft of sufficient size, the poor angular resolution of current gamma-ray telescopes imposes a limit on identification rather than detection. Of the Compton Gamma-Ray Observatory (GRO) instruments, EGRET has an angular resolution of 1.6 degrees at 100 MeV. The best possible resolution of BATSE is 0.5 degrees (Kurfess, 1985, Morris, 1985). In the most favorable circumstances - purely tangential velocity close to c; observations made over the ten-year lifetime of GRO - these resolutions will be able to detect the motion of spacecraft at distances of ~100 parsecs and ~300 parsecs, respectively. The distinctive line emission from these objects is readily detectable if the spacecraft is sufficiently massive. A consumption of ~(1 to 10)Rexp2 tons per second of antimatter is necessary for detection by GRO of a spacecraft at a distance R in pc (Harris, 1991b).

Harris (1991a) reported the negative results of a search for the linear alignments of burst along a potential spacecraft trajectory, using burst locations and spectra observed by the 1978-1980 inter-planetary network of gamma-ray detectors.

Improvements in the measurement of gamma-ray source positions may be expected from two directions. For steady sources and very bright transients, larger detectors will achieve improved signal-to-noise ratios and hence better source positions for a given angular resolution. However, the positions of most of the gamma-ray bursts are measured more accurately from the event delay times across interplanetary distances (Harris, 1991b). Progress in this field is dependent on future space mission launch schedules.

Particle Astronomy

Atomic Microscopic Particles

Another technique of astronomical investigation relies on the observation of microscopic particles which stream toward Earth in huge numbers from different directions. They include elementary particles such as electrons, protons, and heavier and complex atomic particles. The more energetic of these particles are frequently referred to as cosmic rays. Another amazing particle that could be use as an "information carrier" is the neutrino.

Neutrinos

A neutrino is a weakly interacting particle that travels at essentially the speed of the light and has an intrinsic angular momentum of 1/2 (h/4 PI). Neutrinos are produced on Earth by natural radioactivity, nuclear reactors, and high-energy accelerators. There are six types of neutrinos and three flavors of neutrinos and anti-neutrinos. Each are associated with a massive lepton that experiences weak, electromagnetic, and gravitational forces, but not strong interactions. The known leptons are electrons, muons, and taus (in increasing order of their rest masses).

Because neutrinos interact only weakly with matter, they can reach us from otherwise inaccessible regions where photons are trapped. Hence, with neutrinos, we can look inside stars and examine directly energetic physical processes that occur only in stellar interiors. Large detectors, consisting typically of hundreds or thousands of tons of material, are required to observe "astronomical neutrinos".

The neutrino burst detected from Supernova 1987A confirmed the basic theory of core collapse and refined our views of neutrino properties. Twenty neutrinos in the energy range from 6 to 39 MeV were detected over ~12 seconds (Chevalier, 1992). Given the distance to the Large Magellanic Cloud galaxy and the sensitivity of the instruments, the results were consistent with an emission of about 10exp58 neutrinos in the supernova. To have a real idea about the difficulties in the detection of this particle, it was estimated that during those ~12 seconds, more than 10exp11 neutrinos passed through

each square centimeter of Earth. Our technology was only capable of detecting twenty of them.

There have been several proposals to use collimated neutrino beams in the energy range from 1 to 100 GeV as a potential means for telecommunication over global distances of 10exp3 - 10exp4 kilometers (Saenz et al 1977, Uberall et al 1979). Similar proposals for telecommunication for not only global but also interstellar and intergalactic distances were investigated by Subotowicz (1979) and Pasachoff and Kutner (1979).

The main difficulty of all these ideas is the low cross-section of interaction of the neutrino and their very low detection efficiency. Subotowicz (1979) suggested that some advanced civilizations may deliberately shut out emergent civilizations such as ours from the conversation. Generation and detection of neutrinos is so difficult that an advanced civilization may purposely choose such a system in order to find and communicate only with their own level of development.

Electrons, Protons, and Heavy Particles (Cosmic Rays)

Highly energetic protons, neutrons, electrons, positrons, and a wide variety of heavier nucleons constitute the cloud of galactic cosmic ray particles. Anti-nucleons consisting of antimatter have been sought: During the 1980s, anti-protons were found. Unstable sub-nuclear particles are not expected to figure significantly as carriers of cosmic information. Their short lifetimes preclude travel over long distances in the Universe, unless the most extreme energies are assumed.

The energy range of galactic, or possible extragalactic, cosmic ray particles that we can hope to use as carriers of information lies between 10exp11 eV and 10exp21 eV. However, most of the stable cosmic rays are charged, therefore studies at high angular resolution, high spectral (energy) resolution, or high time resolution are not likely to yield a great deal of "information". Galactic magnetic fields scramble all "memory" of where and how the particles originated and make uncertain the time of origin, including the initial energy of the particle.

This kind of information carrier presents several disadvantages for interstellar communication. Due to the electric charge of electrons and protons and their interaction with the magnetic interstellar fields (~ 5x10exp(-6) Gauss), a Lorentz force will act on both particles, but with opposite direction. The relevant relativistic equations are V/c = ((1-(Mexp2 x cexp4))/Eexp2)exp(1/2) and R=MV/QB(1-Vexp2/cexp2)exp(1/2)sen(alpha), where c is the speed of light, V is the particle velocity, M is the particle mass, Q is charge, B is the magnetic flux density, E is the particle energy, R is the curvature radius, and alpha is the angle between the galactic field and the direction of the particle beam.

Assuming the beam is aimed properly, it will curve around and just barely reach the target if R is one-half the distance thereto (Freitas, 1977). If we send a message via high energy protons across ten light years, E must be at least 1.4x10exp16 eV if alpha equals ninety degrees. Of course this assumes a nice uniform B field all the way, a dubious proposition at best. In view of the galactic deflection problem, it is difficult to see how charged particle beams could represent a communication mode for advanced extraterrestrial civilizations.

Macroscopic Objects

The planet Earth is incessantly bombarded by matter whose information content is far from negligible. For example, the stream of extraterrestrial matter gives direct information about the abundance of the elements in the sites where the matter was produced, which mainly involves the history of the solar system. Meteorites are one such group of objects which can be handled and subjected to laboratory tests and analyzes. Meteoric dust brought to Earth by rain or snow can be studied in the same way. The difference here is that these particles or objects can be examined and re-examined in a leisurely way. They are not so transient as individual photons or fermions.

There have been some speculations that a simple biological system carrying a message and capable of self-replication in suitable environments may be one possible channel for interstellar communication (Yokoo and Oshima, 1979, and Nakamura, 1986). These kinds of ideas have several and severe objections. For example, the impossibility to predict the environment of the target star in order to favor the self-replication of the molecular structure, the impossibility to avoid the destruction of the content of the message by the molecular mutations, and the impossibility for us to distinguish between a "natural" organism and a real biological interstellar message.

Direct Techniques

With the development of the Space Age, the way has been opened for a more direct approach to many phases of extraterrestrial exploration. Such probes can transport sensing devices for direct measurements at distant locations and telemeter their findings back to Earth. The human race's capacity for observation and interpretation of diverse and unexpected phenomena make manned exploration the ultimate goal.

In the past thirty years, there have been several proposals of rapid space probes (v > 0.1 c) for interstellar travel purposes, including pulsed fusion and antimatter-powered rockets, laser-pushed light sails, and interstellar ramjets (Mallove and Matloff, 1989). The scale of the undertaking, from both a technological and economic perspective, is such that they are unlikely to be realized for at least one century (Crawford, 1990).

The most ignored factor in discussing interstellar flight is the kinetic energy that must be invested in the ship to make its tons of matter move at a substantial fraction of the speed of light (Oliver, 1981; Purcell, 1959; von Hoerner, 1962). This turns out to be the dominant energy requirement and is thus a useful lower bound on the total. If, in assessing the cost of interstellar travel, we find this lower bound too big, all the other costs can be negligible.

Bracewell (1960, 1975) and Freitas (1980a) have discussed the possible superiority of interstellar probes in missions of galactic exploration. Freitas (1980b) and Valdes and Freitas (1980) have raised the issue of self-organized machines in related context. The non-detectability of the proposed probes has been used as an argument to establish that we are the only technological civilization in the entire Milky Way galaxy (Tipler, 1980).

Under the assumption that an extraterrestrial probe will be interested in life in our solar system, a near-Earth search was carried out for these kinds of artificial objects by Freitas and Valdes (1980, 1983, 1985). Other proposals to search for extraterrestrial artifacts in our neighborhood were proposed by Papagiannis (1978, 1985).

Errata -

The following are corrections of errors made in Part 1 of this article in the December 1993 issue of the EJASA. I regret the errors and apologize for them. I thank Guillermo A. Lemarchand for finding and correcting the information. - The Editor

The text reads:

TYPE II: A civilization capable of utilizing and channeling the entire radiation output of its star. The energy utilization would then be comparable to the luminosity of our Sun, about 4x1026 Watts.

It should read 4x10exp26 Watts.

The text reads:

structures in the range 3 Kelvin s T s 300 K, the consumption of energy in the range 1 Luminosity (Sun) s L s 10exp12 L(Sun), structures with sizes up to 100 kiloparsecs (kpc), and distances up to Dw 1000 megaparsecs (mpc). One parsec equals 3.26 light years.

It should read "3 Kelvin s Ts 300 K" (the symbol is minor or equal combination of < and =). The next line should read "1 Luminosity (Sun) s Ls 10exp12 L (Sun)". Where it says Dw 1000 megaparsecs (mpc) it should read "~ 1000 megaparsecs (Mpc)", using the symbol of "almost equal" and "Mpc", not milliparsecs (mpc).

The text reads:

now, only a small fraction of the whole Haystack has been explored (w 10exp(-15) - 10exp(-16)).

Instead of w it should read ~.

The text reads:

modest "Type 0" (w10exp13 W/Hz, Rw0.4 A.U., Dw5000 m, and lambdaw1 m) to the transition from "Type I" to "Type II" (w2x10exp24 W/Hz, Rw0.4 A.U., Dw10 m, lambdaw1 mm).

Replace w per ~, and Rw per r, Dw per ~, and so on.

The text reads:

In 1993, MANIA was used from the 2.15-meter telescope of the Complejo Astronomico El Leoncito in Argentina, to examine fifty nearby solar-type stars for the presence of laser pulses (Lemarchand et al, 1993).

This MANIA project did *not* take place in 1993.

The text reads:

resonance line. If we consider that the typical spectral line width might be about 1, and if we assume that a ten percent absorption

After 1 it should read 1 armstrong.

: thought that ringing was an inevitable result of narrow bandwidths. ...
: I used to think that an effective bandwidth of some
: 200-300 Hz. was about minimum and that less than that would cause so
: much ringing that weak signals would be lost. ...

: Can someone with a great deal more technical knowledge than I have
: state just what is the minimum usable bandwidth for a 10-20 WPM CW
: signal, and how much audible ringing is truly inescapable?

For a single-resonator bandpass filter, I believe that the formula is

TC = 1 / (PI*BW)

Where TC is the time constant of the ringing (time it takes the tone to die off to .37 the initial value), PI = 3.14, and BW = 3 dB bandwidth of the filter. If you have a number of isolated, cascaded, identical resonators, then I think the above formula is still approximately correct, where BW is now the 3 dB bandwidth of the entire filter. Someone more knowledgable than I might want to post the exact formula.

When all the resonators are tuned to the same frequency, the filter shape has a humped, or rounded response. You can think of a "flat-top" filter as being made of a number of narrow-band (high-Q) filters stagger-tuned across the passband. Since each filter has a much narrower bandwidth than the filter as a whole, flat-top filters have worse ringing than "round-top" filters.

You can also make a flat-top filter by overcoupling resonators that are nominally tuned to the same frequency. Although it's not as easy to visualize, this method has exactly the same ringing problem as the stagger-tuned method.

Bottom line: There is a tradeoff between having good pulse response (less ringing) with a round-top filter, versus having a flat passband and good ultimate rejection (but poorer pulse response).

So to answer your question about minimum usable filter bandwidth:
It depends on your desired keying speed (baud rate). 48 wpm Morse code results in 20 dots per second, or 0.025 seconds between dots (50% on/off ratio.) Let's assume the tone must die off to 5% (-26 dB) of its maximum value during this off time. That requires 3 time constants:

TC = 3 / (PI*BW) ---> BW = 3 / (PI*TC)

BW = 3 / (3.14*0.025) = 38 Hz

For a flat-top filter, the bandwidth must be greater, as discussed above.

Digital filters, whether implemented by a DSP or some other way, have a similar problem. If an IIR (infinite impulse response) filter is used, the analysis is exactly the same as with an analog filter. FIR (finite impulse response) filters have the advantage that the response decays exactly to zero at some point. (Whereas IIR and analog filters theoretically have an infinite "tail.") But even with an FIR filter, the ringing gets longer the narrower the bandwidth.

The latest issue of Radio Communications has a good (i.e., informative)
review of the OMNI VI. THe respected reviewer notes that the Ten Tec
still has the very best close in selectivity and performance of any rig
available to amateurs. The margin is as much as 20 db better than the
high priced competition.

684. The DSP nobody mentioned

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-25 21:51:16 UTC
From: milewski@oregon.uoregon.edu
Message-ID: <milewski-250194133201@fp2-st-affairs-11.uoregon.edu>
Source record: 271971

While a guest at the Willamette Valley DX Association meeting a few months ago, they had a demonstartion of a DSP filter which completely blew everyone away.

The main difference between the particlar unit they demonstrated and all the other units we've heard about here on the net is that fact that the filtration is all software configurable.

In addition to running the library of filters already included with the unit, you can design your own by using your PC. From what I understand of how it works, the computer samples the audio that you are analyizing. Then, this audio is displayed graphically. By highlighting the "peaks" of the display and drawing "cut-off" lines at the noise, you can build your own library of filters for various operating situations.

Thus, it is possible to construct a filter for the specific characteristics of an individual voice (great for those skeds on crowded bands, eh?).

At the meeting, a demonstration of how the filter can be used to help pull out extremely weak signals from atmospheric noise was also performed. In this instance they used a sample of a moonbounce CW signal. Without the filter, one would be hard pressed to even imagine the existence of a signal. With it, you could copy very distinctly. Don't get me wrong, it was still extremely weak, but you could copy it.

Everyone was impressed, to say the least. Especially when they found that the cost was only in the $330 range. Apparently these things sold out at Dayton last year and the backlog on orders was phenomenal.

A friend of mine, Steve, AI7W, bought one recently and here's a short description from him:

My DSP's model is the DSP-120, it's made by Digital Interactive Signal Corp.. It has 8 programable filter memories and connects to the parallel interface of a P.C. (386 with VGA or better). It provides a real time audio spectrum display and a digital recording feature as well as providing a number of ways to custom design filters. Sets of 8 filter designs can be stored as files on the P.C. making it possible to have an almost unlimited number of filters.

If you're interested in DSP, this is definitely wirth looking into.

I think you should consider the worst case - not just the average
case. The worst case is with numbers such as 5.

The average english word length (from ARRL Handbook) is 25 dots.

So, 120 wpm represents a rate of 120*25/60= 50 dots/sec.

>
>The bandwith at 120 wpm is in the range of 24-72Hz, assuming no drift,
>no off-tuning and well shaped signals.

Each dot is encoded by an dot time length on and a dot time length off, i.e., a
cycle of twice the dot lenght. This is like multiplying a 50Hz square wave
with a 750 Hz tone. To maintain some semblance of square shape,
one would want to include the fundamental and at least the third harmonic.
This results in a minimum bandwidth of 150Hz. If you include the 5th
harmonic then this goes up to 250Hz.

Approximately, for Line-of-Sight propagation:
d = sqrt(2h)
where d is the maximum distance (radius if the area is flat) in miles
h is the height above average terrain in feet.

Sorry fellows, I made a typo on the posting. I was referring to
the ICOM IC-R70.

I also checked the problem by turning off the receiver with the
0.1kHz button pushed on. In this case the shift is 1.6kHz. I'm
puzzled, I don't know if this is a mechanical or an electrical
problem. Thanks to those who sent me ideas. Cheers,

Dan.

This may be a case where the "new" and "great" technology is working
against you. The typical solid-state ricebox of today is NOT built to
operate in the near field of a strong RF source...

An older "hollow-state" rig will not have the same problems, though it
is more likely to have a 1240KHz 2nd IF, which makes for real fun...

About 1976, I helped a ham install a dipole for 75 meters, with one
end of a long concatonary arch (hey, I never said I could type or
spell ;^) attached at the radome of the FM antenna on a 350 foot
broadcast tower with the AM running.... yep, 1240KHz! The antenna was
flat-topped at 150 feet up, directly over the transmitter shed. He had
the strongest signal on 75 at the time...unless you count W2HCW and
his 3-element beam! His SP600 wasn't bothered by the 1240KHz STRONG
local signal.

I don't know if a modern solid-state rig can deal with all the RF
floating around, but a tube rig without a 1240 IF sure could...
So, take the less expensive route and buy an older HF rig at a HamFest
and stop worrying...

694. A43YY - QSL route

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-26 05:54:52 UTC
From: oo7@astro.as.utexas.edu
Message-ID: <2i50jc$ev3@geraldo.cc.utexas.edu>
Source record: 271985

Does anyone know anything about A43YY and a QSL route? I have
been getting QSL cards from Japan but I am not the QSL manager.
I know how the misinformation started - quite innocently and
understandably - but would like to tell people how to reach this
op when I send their cards back. The W6GO/K6HHD list gives A47RS
(the A4 club station) as the route for A43XX, but I dunno whether
XX and YY are related in any way. I have the latest international
callbook and A43YY is not listed there.

Thanks for any help or suggestions,

NOTE: The Effective Sunspot Number for 24 JAN 94 was 56.0.
The Full Kp Indices for 24 JAN 94 are: 2o 1- 1o 2- 0o 1- 1o 1o

SYNOPSIS OF ACT

Solar activity was moderate. Region 7654 (N08W50)
produced an M1/1N long duration flare at 25/1836Z. Region 7658
(N13W24) continued to grow rapidly during the period. Its area
has increased from 90 to 160 mils in the last 24 hours.

Solar activity forecast: solar activity is expected to be
low to moderate due to Regions 7654 and 7658.

STD: Extremely intense Fe XIV and Fe X emissions were observed
on the east limb yesterday, 24 January. At the present time,
no associated Ca XV emissions have been observed from this
highly emissive area. The responsible solar region has not

yet been spotted, but should rotate into view shortly.

The geomagnetic field has been at quiet levels for
the past 24 hours.

Geophysical activity forecast: the geomagnetic field is
expected to be unsettled at mid latitudes and active to minor
storm at high latitudes. A coronal hole will be favorably
positioned during the next three days. A disappearing filament
may also contribute to a disturbance on day one.

Event probabilities 26 jan-28 jan

Class M 25/25/25
Class X 05/05/05
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 26 jan-28 jan

A. Middle Latitudes
Active 25/25/25
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

B. High Latitudes
Active 25/25/25
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

HF propagation conditions were normal over all regions. A
minor SWF was observed in conjunction with the M1.6 flare.
Minor signal degradation over the high and polar latitudes is
still expected over the next 48 to 72 hours. Nothing
particularly significant is anticipated, although degradation
should push propagation qualities to occasionally very poor
levels during high-latitude substorm activity, for transauroral
and transpolar circuits. Middle latitudes should observe
mostly near-normal propagation, with above normal fading and
some multipathing possible during the local night hours.

1858 1901 1904 C1.2 III

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

Hi, Scott:

After a 30 minute lag due to technical problems, the show finally went on
at 6:30pm EST.

Fred Maia, W5YI, was the guest of honor. Due to the short time he had,
Fred briefly summarized everything his empire has available for hams and
ham-wanna-bees.

They also had time for two callers at the end of the show.

I also heard the show on 1510AM, WSSH.

73,
Scott

>am starting to look for a 2 meter radio. I will also trade the above setup,
>for a good 2 meter setup, make me an offer.

Not if I can help it. I will use any influence I have left as the Former
Public Service Director of the Northern Alberta Radio Club, and any avenues
of information transfer, such as the Packet Radio system, to ensure that people
of your kind are carefully scrutinized. This will not prevent you receiving
your ticket, but it may make you very uncomfortable when your past catches up
with you.

I was shocked from this message !! I always thought that Amateur Radio
was created and is still popular due to it's promotion of friendship !!
So what if the man was a "pirate", what matters *now* is the fact that
he is going straight !!! If he seems to be sincere about his "turn around"
he should be given the chance to do so !!!
Every possible effort must be made to reform the radio pirates with the
real *amateur" way, not with threats and vengence like you have done !!

103rd Congress 10/15 Print
1st Session (Text Only)

H.R.2623

To amend the Communications Act of 1934 in order to facilitate utilization
of volunteer resources on behalf of the Amateur Radio Service.

_____

IN THE HOUSE OF REPRESENTATIVES
June 13, 1993

Mr. Slattery introduced the following bill; which was
read and referred to the Energy and Commerce Committee

_____

A BILL

To amend the Communications Act of 1934 in order to facilitate
utilization of
volunteer resources on behalf of the Amateur Radio Service.

Be it enacted by the Senate and House of Representatives of
the United States of America in Congress assembled,

SECTION I. SHORT TITLE
This Act may be cited as the "Amateur Radio Volunteer Services
Act of 1993."
SECTION II. FINDINGS AND PURPOSE
(a) Findings. - The Congress finds and declares that -
(1) Since 1982, following the enactment of P.L. 97-259,
the Federal Communications Commission has been authorized to
utilize volunteer assistance of licensees in the Amateur Radio
Service for:
(A) the preparation and administration of amateur
radio license examinations, and
(B) on-air monitoring for violations in the Amateur
Radio Service;
(2) these volunteer services provided by individual
amateur radio licensees have greatly enhanced the self-regulatory
character of the Service, and have saved the Commission countless
hours of staff time and other resources; and
(3) the success of these volunteer programs to date
should be noted, encouraged and expanded;
(4) Public Law 102-538 now authorizes the Commission to
accept the voluntary, uncompensated and unreimbursed services of

amateur radio organizations in administration of club and military recreation station call signs;
(5) a principal threat to the continuation of each of these programs is the perception that volunteers put personal assets at risk in the event of actions against them, as the result of their provision of the volunteer services;
(6) this perception may result in non-participation of volunteers or withdrawal from volunteer service;
(7) the protection of voluntarism in these specific programs, through clarification and limitation of the personal risks assumed by the volunteer in connection with such participation in these enumerated programs, is necessary and reasonable.

Amateur Radio Volunteer Services Act of 1993.
Page Two

(b) Purpose. - It is the purpose of this Act to -
(1) protect the provision of volunteer services to the Federal Communications Commission as provided for in the

Communications Act of 1934, as amended, in the administration of the Amateur Radio Service; and
(2) sustain the availability of volunteer programs which benefit the Amateur Radio Service, which has provided a model of self-administration and self-enforcement among the radio services administered by the Federal
Communications Commission.

SECTION III. FACILITATION OF VOLUNTEER SERVICES TO THE FEDERAL COMMUNICATIONS COMMISSION IN PROGRAMS BENEFITTING THE AMATEUR RADIO SERVICE

Section 4(f)(4) of the Communications Act of 1934, as amended [47 U.S.C. 4(f)(4)], is hereby amended to include a new subparagraph (K) to read as follows:
(K) Except as provided otherwise herein, no individual licensee in the Amateur Radio Service who provides volunteer services pursuant to subparagraphs (A), (B) and (C) of this paragraph, or pursuant to paragraph (g)(3)(B) hereinbelow, shall incur personal financial responsibility for any alleged damage, loss or injury from any act or omission of the volunteer from the provision of such volunteer services, if such individual was acting in good faith and within the scope of such individual's official function and duties in providing the volunteer services as defined in subparagraphs (A), (B) or (C) of this paragraph, or as defined in paragraph (g)(3)(B); and provided that such damage, loss or injury was not caused by willful and wanton misconduct by such individual.

701. JOINT RESOLUTION To recognize achievements of radio amateurs

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-26 12:34:38 UTC
From: marcbg@netcom.com
Message-ID: <$jr90.1994@ampr.org>
Source record: 271997
Cross-posted to: rec.radio.amateur.misc,rec.radio.info,sbay.hams

JOINT RESOLUTION S.J.Res. 90 & H.J.Res.199

To recognize achievements of radio amateurs, and to establish
support for such amateurs as National Policy

WHEREAS, Congress has expressed its determination in section 1 of the
Communications Act of 1934 [47 U.S.C. 151] to promote safety of life and
property through the use of radio communication;

WHEREAS, Congress, in section 7 of the Communications Act [47 U.S.C. 157],
has established a policy to encourage the provision of new technologies and
services;
WHEREAS, Congress, in section 3 of the Communications Act of 1934, defined
radio stations to include amateur stations operated by persons interested in
radio technique without pecuniary interest;

WHEREAS, the Federal Communications Commission has created an effective
regulatory framework through which the amateur radio service has been
able to
achieve the goals of the service;

WHEREAS, these regulations, set forth in part 97, of title 47 of the Code of
Federal Regulations, clarify and extend the purposes of the amateur radio
service as a --
(1) voluntary noncommercial communication service particularly with
respect to providing emergency communications;
(2) as a contributing service to the advancement of the
telecommunications
infrastructure;
(3) as a service which encourages improvement of an individual's
technical
and operating skills;
(4) as a service providing a national reservoir of trained operators,
technicians and electronics experts; and
(5) as a service enhancing international good will;

WHEREAS, Congress finds that members of the amateur radio service
community has
provided invaluable emergency communications services following such
disasters
as Hurricanes Hugo, Andrew and Iniki, the Mt. St. Helens eruption, the Loma
Prieta earthquake, tornadoes, floods, wild fires and industrial accidents in
great number and variety across the Nation; and

WHEREAS, Congress finds that the amateur radio service has made a contribution
to our nation's communications by its crafting, in 1961, of the first earth satellite licensed by the Federal Communications Commission, by its proof-of-concept for search and rescue satellites, by its continued exploration of the
low earth orbit in particular pointing the way to commercial use thereof in the
1990s, by its pioneering of communications using reflections from meteor trails, a technique now used for certain government and commercial communications, and by its leading role in development of low-cost, practical data transmission by radio which increasingly is being put to extensive use in,
for instance, the land mobile service:

Now, therefore, be it
Resolved by the Senate and House of Representatives of the United States of America in Congress assembled,
SECTION 1. FINDINGS AND DECLARATIONS OF CONGRESS.
Congress finds and declares that --
(1) radio amateurs are hereby commended for their contributions to technical progress in electronics, and for their emergency radio communications
in times of disaster;
(2) the Federal Communications Commission is urged to continue and enhance the development of the amateur radio service as a public benefit by adopting rules and regulations which encourage the use of new technologies within
the amateur radio service; and
(3) reasonable accommodation should be made for the effective operation of amateur radio from residences, private vehicles and public areas, and that regulation at all levels of government facilitate and encourage amateur radio operation as a public benefit.

703. Of Wouff Hongs and Royal Rites

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-26 13:46:12 UTC
From: jwittich@b4pph107.bnr.ca
Message-ID: <1994Jan26.134612.8836@brtph560.bnr.ca>
Source record: 272002

Hi, everybody. Well, its about spring, and that means we are
getting ready for the local HamFest round here. Im looking
at the hamfest flyer, and one on the events listed is
The Royal Order of Whoff Hong Induction. Well ya see, Im kind
of a new guy, and dunno what thats all about. I asked about it
the local 2 meter repeater, and you should have heard the
snickers and snorks. I quickly surmised that it was a secret.
So keeping with the spirit of fun, I will not just ask
what this is all about, but I do have a few questions:

1. Is it something that the OFs will enjoy at us new guys expense?

2. Is it an event that I would prefer no one had a camera at?

3. Would I be any less likely to get home that night than any
other night?

4. Will my health insurance cover anything thats likely to happen?

5. Is there a potential for any embarassment to any involved?

6. Could I be black-mailed for being there?

7. Why am I so paranoid about this?

Thanks guys, and heres the Email address:
jwittich@b4pph107.bnr.ca

I will let you know what happened (maybe) in May.
C ya.

-=Jeff=- AC4ZO BNR claims they know nothing of my employment
here. Specially when my attorney calls.

If he was in this country, and the FCC caught him, he would get in very
serious trouble. If we allow this sort of thing to thing to persist,
we'll have a service that will be unusable. How do we know this person
will stay straight, we don't.

Well that's what the power company is going to do. Many problems like this are due to something coming loose mechanically on the pole. Jarring it is the way they pin it down. This *is* best left to professionals, however, since a possibility exists that striking the pole could make a permanent short, or drop something on you.

Read the FT-415 mods. Exactly the same internally. Get 'em of FTP from world.std.com! But the extend tx mod will kill your Automatic repeater offset (ARO), so you have to be willing to loose that.

716. CW filters and DSP-9: A recap of mimimum bandwidth

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-26 17:29:21 UTC
From: rdewan@casbah.acns.nwu.edu
Message-ID: <2i699h$6sc@news.acns.nwu.edu>
Source record: 272021

In the thread on minimum bandwidth required for CW signal:

Ignacy, NO9E wrote:
The bandwith at 20 wpm (corrected from 120wpm in an earlier post) is in the
range of 24-72Hz, assuming no drift, no off-tuning and well shaped signals.
^^^^^^^

For CW at 120WPM I wrote:
To maintain some semblance of square shape, one would want to include
the fundamental and at least the third harmonic. This results in a
minimum bandwidth of 150Hz. If you include the 5th harmonic then this
goes up to 250Hz.
This scaled for 20WPM results in a minimum bandwidth estimate of 30-50Hz.
^^^^^^^^
Al, N1AL wrote:
So to answer your question about minimum usable filter bandwidth:
It depends on your desired keying speed (baud rate). 48 wpm Morse code
results in 20 dots per second, or 0.025 seconds between dots (50%
on/off ratio.) Let's assume the tone must die off to 5% (-26 dB) of
its maximum value during this off time. That requires 3 time constants:
TC = 3 / (PI*BW) ---> BW = 3 / (PI*TC)
BW = 3 / (3.14*0.025) = 38 Hz
For a flat-top filter, the bandwidth must be greater, as discussed above.
Scaled to 20wpm, it is 16Hz. or greater for flat top filter.
^^^^
So Ignacy and my estimate, arrived from different approaches, pretty
much agree. Al's estimate, derived using yet another approach, is
lower. Al assumes that a decay to 5% of a dot signal by the time the
next one starts is ok. I do not quite know how this would sound,
but if you require that this occur in half the `off' time then his
estimate would creep up to 32Hz. Is this reasonable?

>tell me to go beat on the pole!
>
From a pratical standpoint, i.e. finding the noise, beating on the pole may
show exactly where the moise comes from.
AM radio will not give much directionality from line noise. It propagates
great distances at AM frequencies. You need 200+ MHz. which probably doesn't
help you much. Try a Aircraft frequency scanner and shield it with your body
to get idea of direction.
Don't be shy about calling power company if you are pretty sure it is their
problem. They are inviolation of FCC regulation and probably have some more
serious problem festering if it cycles at 1-2 seconds and has such a wide
band width. Most power companies have RFI "sniffers" that can locate it
to within a bolt on the pole.
I've had much experience with power companies all over the country. Some
are good abt helping--some are not. Often if nothing is solved in a few
months, I threaten to complain with state utility commission. Every time
I've done that, the problem was corrected within 2 days!
Good luck--it can be a frustrating nuisance.
73, Ned AB6FI

I'm looking for the source for Ioncap, which I understand to have been developed by the US Gov't and be in the public domain. I suppose I could get it through NTIS on 9-track tape for a hundred or so bucks, but I'm hoping someone knows of an ftp site for it.

While we're at it, how about the source for minimuf?

Thanks,
-Steve

>this are due to something coming loose mechanically on the pole. Jarring
>it is the way they pin it down. This *is* best left to professionals,

An employee of our power company (Tucson Electric Power) is employed to track
down power line interference by using radio direction finding equipment. He has a variety
of radios in his truck, as well as a hand-held yagi (that looks as if
it's cut for around 450 MHz). He is getting to be really good at this, and has
recently helped me out by getting some ten or so poles in my neighborhood
repaired. No more noise!

The point of all this is that taking a sledgehammer to a pole is not the only
way to pin down the noise.

That's right. A very narrow band-pass filter can make broadband noise sound like a raspy tone. I believe that flat-top filters also make this problem worse than Gaussian filters of the same bandwidth.

: I assume that G is an average-size letter in Morse and the
: transmission is at 120 wpm (2 characters/s). ...

120 wpm is 2 WORDS per second, or about 10 characters per second.

In my previous posting, I analyzed the required bandwidth based on
a ringing fall-off rate of three time constants during the "off"
time between dits and dahs. Ignacy's method of looking at the
frequency content of the baseband signal (i.e. the keying rate)
is also valid.

The highest pulse repetition frequency is when you are sending a
string of dits (for example, the letter H or the number 5.)
My previous example of 48 wpm results in 20 dots per second.
A Morse code signal can be considered to be an AM (ampltidude
modulated) signal that is 100% modulated with a square wave, in
this case a 20 Hz square wave. Since an AM signal has two sidebands,
the bandwidth must be at least 40 Hz.

My previous result was 38 Hz, in good agreement with the above result.
The required bandwidth is proportional to keying speed so, for example,
24 wpm would require about 20 Hz, etc.

>we'll have a service that will be unusable. How do we know this person
>will stay straight, we don't.

> Matt Roberts n3gzm

One listen on 14.313 Matt will show you that one's background has nothing to do with how good an operator or ham he will be. Listen during some of the DX pile-ups, the majority of the guys that transmit out of band, because they forget how to run the "split" on their transceiver, have 2by1 callsigns. I know of a number of hams that got their start on CB radio, and are good hams and legal operators, even though their early days in radio were not too savory. What Demetre and I ahve been trying to say is, give the guy a break, he may change and be a perfectly fine ham if someone were to extend the right hand of fellowship to him and get him squared away. The problem is that some guys get too vindictive, and and get their Jr. FCC hat on, and can't see the forest for the trees.

i had to replace the final trans. on my ft690r
and forgot where a capacitor and a resistor went
would anyone have a schematic or have a ft 690r
that they could look at and tell me?

i also managed to break a wire loose too,
one end is conected to a post at th rear
cornner near the final trans. and goes towards the
side by the standby jack, its a toroidal choke.

help if you can
thanks
terrance

Thanks, Jack, for the tip on the Icom dial. Hope this gets into the "mods"
archives in the future.
Just curious if this applies to the Icom 735 - will look at it tonight.
I hope you didn't wear out that tuning dial in two weeks!

740. How to "Convert" Ham Radio HyperCard Stack?

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-27 02:23:40 UTC
From: miles@mbs.telesys.utexas.edu
Message-ID: <miles-260194202250@slip-7-14.ots.utexas.edu>
Source record: 271882
Cross-posted to: rec.radio.amateur.misc,comp.sys.mac.hypercard

I have a copy of the Macintosh Novice Ham Stack, dated mid-93, used for drilling folk who want to become ham radio operators. It has been personalized by a person named Mark, and I can't figure out how to insert my daughter's name.

When she completes a practice test and tries to save her score, she gets this error message: "This stack has not been converted. It must be converted before it can be modified."

This may involve the fact that I am using HyperCard 2.1. The stack shows a padlock symbol, but is not locked in the Get Info box.

Any ideas? Thank you.

>.. I was wondering if there are any freqs that people
>normally listen to for contacts?

Jeff -- There is really no "calling frequency" on 10 meters, although some people occasionally try to set one up. Just get on and call CQ, or answer someone else who is doing so. There are still a lot of 10 meter nets around, especially with the 10-10 chapters, but propagation is so unpredictable that it's tough to say what ones you could contact. If you hear a net that sounds interesting, don't hesitate to jump in -- you can wait until they ask for check-ins, or just give your callsign at a break in the conversation.

You'll find a lot of action next summer, when sporadic-E propagation returns on a regular basis. You won't work a lot of DX on this mode, but you can work all over the U.S. and Canada. I hope we run into each other, since New York is one of the few states I still need on 10 meters. We're too far for ground-wave, but too close except for very strong sporadic-E openings. And since I operate 100 watts into a wire antenna, back-scatter is pretty tough.

Congratulations on the upgrade, and I hope to see you on 40 or 80 meter CW!

<Graylan_Vincent@walnut.prs.k12.nj.us> writes:

>know code well) and someone showed me a book. I think it was called
>"Now Your Talking", but I'm not sure. I really want to find out how to get
>started with some cheap, but good equipment. What is the name of the
>booklet at Radio Shack that I can get?

Graylan -- You have it correct -- the book is "Now You're Talking," and it
is available at many Radio Shacks (as well as direct from the American Radio
Relay League). Radio Shack also has some other license preparation material,
but I think this is the best one.

There
is nothing wrong with starting with a No-Code Tech. license (that's the way
most people are starting these days), but try to learn the CW. Radio Shack
has some good CW tapes from Gordon West, and it's really not hard if you keep
at it. The biggest thing to know is that EVERYBODY hits a couple of plateaus
in learning CW where it seems as though you're not picking anything up, and are
even having difficulty with what you already learned. The first two times I
tried to learn CW, I hit these plateaus, thought I couldn't learn it, and quit.
In fact, after one of these plateaus, you tend to pick things up pretty easily
for the next few sessions. It's almost like your brain is just taking time to
really absorb what you've learned.

Good luck!

While there are no formal calling freqs in the Ten Meter Novice band, there are several freqs that are good places to call CQ.

I find 28.400 has a lot of US ops, and 28.495 can get foriegn DXers when the band is in good shape. For CW, 28.150 is also sort of an informal calling freq. 28.135 is used as an AMTOR calling frequency.

: get the same deal out of them. Thanks Bill--AA5ZQ

As far as I know Pac-Tel has always done this. OUr local club repeater is
also listed as a priority number since it is used for emergency and could
be important during emergencies. I would be surprised if you couldn't
get residential rates on your machine.

good luck,
Dan

!!END-DATA!!

NOTE: The Effective Sunspot Number for 25 JAN 94 was 65.0.
The Full Kp Indices for 25 JAN 94 are: 1o 2o 1+ 1- 2- 1o 1+ 1o

SYNOPSIS OF ACT

Solar activity was moderate. Region 7654 (N08W63)
produced a long duration M1/SF flare at 26/0136. The event was
preceded by a C2/SF which peaked at 26/0118 and was followed by
a C6/SF which peaked at 26/0200. The region continues to show
growth as it approaches the west limb. Regions 7658 (N12W38)
and 7661 (N08E11) have also shown some growth this period. All
other regions are stable.

Solar activity forecast: solar activity is expected to be
low to moderate due to the continued growth of Regions 7654,
7658, and 7661.

The geomagnetic field has been at quiet to mostly active
levels with a brief period of minor storming occurring during
the 06-09Z period at middle latitudes and minor to major
storming occurring during the 12-18Z time frame at higher
latitudes.

Geophysical activity forecast: the geomagnetic field is
expected to be at unsettled to active levels for the next two
days due to a favorably positioned coronal hole. Levels
should be quiet to unsettled on day three.

Event probabilities 27 jan-29 jan

Class M 45/45/45
Class X 05/05/05
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 27 jan-29 jan

A. Middle Latitudes
Active 25/35/15
Minor Storm 20/10/01
Major-Severe Storm 05/05/01

B. High Latitudes
Active 20/25/20
Minor Storm 35/25/10
Major-Severe Storm 05/05/01

HF propagation conditions were normal over all but the
high and polar latitude paths where the effects of the sporadic
geomagnetic storming produced periods of poor propagation.
Conditions appeared to be improving slightly toward the end of
the UTC day. Additional periods of minor signal degradation
can be expected over the next day or two as effects from a well
placed coronal hole begin to degrade propagation. Deterioration
will be strongest (with fair to occassionally very poor)
propagation over the high and polar latitude night-sector
circuits.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

Local news for VK2 WIA members
==============================
As a result of a meeting of concerned members of the WIA which
was held in Sydney recently, a committee has been formed to
encourage independent candidates to seek election to the
Council of the NSW Division of the WIA at the forthcoming
Council elections.

The committee consists of Peter Naish VK2BPN, Bob Mayer
VK2BMU, John Brooke VK2FUR, Alan Dark VK2XAT, Roger Henley
VK2ZIG. No member of the committee will stand as a candidate.

The committee can be contacted at PO Box 372 West Ryde NSW
2114.

Guidelines for the preparation of programs for transmission by
--- Amateur Radio Teletype
======================
from Frank VK2FJL
part 2.
----

(2) UNSHIFT-ON-SPACE.
Some RTTY machines and most computers automatically change
from (FIGS) to (LTRS) every time a (space) is received.
To defeat this feature when text containing both spaces and
figures is being prepared : e.g. Satellite predictions, it

is necessary to insert a (FIGS) immediately before each
upper case character which follows a (space).

(3) PARAGRAPHS.
Commence each paragraph with an extra (CR)(LF) - i.e.double
spacing - and type four spaces plus a (LTRS) or (FIGS) be-
fore commencing the text.

(4) HEADINGS.
Un-numbered headings should commence at the lefthand margin
and be underlined using the hyphen on the next line, with
double spacing both above and below the underlined heading.

(5) PUNCTUATION.
Your layout will look neater and text be more readable if
the following suggestions are used.

(A) FULL STOP - This follows directly behind the previous
letter, but allow two spaces after each full stop.
This may later be expanded or contracted to fill the
line to the right-hand margin.

(B) COMMA - This also follows directly behind the previous
letter, but with only one space to follow.

(C) HYPHEN - When used to punctuate a sentence - type
(SPACE)(FIGS)(HYPHEN)(LTRS)(SPACE) and resume the text.
This can later be expanded to two spaces on either side
if required for line fill.

(D) QUESTION MARK - This looks better when preceeded by a
space and followed by two spaces. Like the full stop,
This may be expanded or contracted for line fill.

(E) COLON - Also provides clearer text when preceeded and
followed by at least one space.

(6) TABOO'S.
The use of the following characters should be avoided as
different keyboards will them as print different things :
semi-colon, equals, percent, dollar sign, pound sign, plus,
ampersand, quotes, maltese cross, exclamation mark and
the bell.
The question mark, colon, hyphen and apostrophe also differ
on some keyboards, but as their use cannot be restricted
entirely, it is obviously impossible to please all of the
people all of the time.

14 January - 20 January 1994

Issue no.: 03

Date of issue: 21 January 1994

Date 14 15 16 17 18 19 20
10cm 90 96 100 105 101 103 105
A 18 18 14 23 21 21 (10 estimated)
T 63 42 11 41 59 25 29

Summary of activity

Solar activity was very low 14th-15th January, and 17th-20th. Activity was high on 16th with an M6 flare.

The geomagnetic field at Learmonth (WA) ranged from unsettled to unsettled to active with a minor storm period during local night on 19th.

Ionospheric F2 critical frequencies at Sydney were slightly above predicted values on 14th and 18th, near normal most of 15th, 17th and 20th, and slightly below on part of 15th, and 19th. Sporadic E blanketing was often present from 15th - 18th January.

Comment:
Sporadic E was often observed this week. HF conditions may have been degraded due to mild geomagnetic activity which has more or less persisted since January 11th. The source of this enhanced geomagnetic activity is thought to be a broad south polar coronal hole.

IPS Monthly predicted smooth T-indices

Year JAN FEB MAR APR MAY JUN JUL AUG SEP OCT NOV DEC

Forecast for the next week (21 - 27 January)

Solar : Low, chance for isolated low level M class flare.

Geomagnetic: Mostly unsettled with active period expected during January 22-23 and January 27-29 (coronal holes).

Ionospheric: Propagation conditions are expected to be fair, with degradations expected on January 22, 23 and 27 to 29.

> I just got my HF privs, and was wondering if there
>are any nets or clubs operating on 10m now? I heard
>Costa Rica and Phenoex,Az this afternoon from Ithaca,NY

First, congrats on the 10m privileges! The only net I know of is here in Virginia at 28.470 Wednesday at 0000Z. But conditions from New York to Virginia are rarely any good on 10 meters to have a conversation (if you're even lucky enough to hear a Virginia station).

>.. I was wondering if there are any freqs that people
>normally listen to for contacts?

Best thing to do is just scan around the band. I don't think there are any frequencies that are used regularly for contacts. If you want to call CQ, find a clear frequency somewhere in the middle of the band and start calling.

Hope this helps out..

Rajiv Dewan (rdewan@casbah.acns.nwu.edu) wrote:

> In the thread on minimum bandwidth required for CW signal:

[Estimates between 16 and 72 Hz arrived from different approaches]

This approach is based on the Modulation and Demodulation chapter in
the ARRL handbook.

The baud rate BR is defined as WPM / 1.2 and thus 20 WPM is about 16.7 Baud.
The bandwidth BW is define as K * BR. Both CCIR and FCC recomend K = 3
for non-fading circuits and K = 5 for (selectively) fading circuits.
Thus 20 WPM requires 50 Hz or 83 Hz if 5th harmonic is included.

In the same chapter, there is a graph with rise and fall time vs. maximum
speed and rise/fall time vs. required bandwidth. If 5 ms rise and fall
times are used (recomended by the ARRL) the maximum speed for non-fading
circuits is 60 WPM and 45 WPM for fading circuits.

At 5 ms rise/fall times the occupied bandwidth is about 150 Hz (-23 dB).
If we assume typical speeds (12-20 WPM), the transmitted spectrum is
dominated by frequency components from the rise/fall transition and not
from the information contents of the signal. Except for a relatively few
high speed operators, the rise/fall time recomendation could be increased,
which would reduce the occupied bandwidth.

Using receiver filters which are narrower than 150 Hz will increase the
post-detection rise/and fall times, but the impulse response of the
filter becomes more critical. At below 50 Hz and the third harmonic is
attenuated making aural reception very hard but machine reception of
20 WPM should be possible down to 17 Hz bandwidth.

752. DSP-9 Filters (and others) -- New Thread

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-27 13:39:12 UTC
From: root@jackatak.raider.net
Message-ID: <24cTgc1w165w@jackatak.raider.net>
Source record: 271843
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

The thread of DSP-9 (etc) Digital Filters and bandwidth/ringing has pretty well wound down, and while I do not mean to fire that discussion up, I am seeking information on a different aspect of these lovely little devices:

Several hams using these filters have reported problems, both on the Nets and to the manufacturers, when engaging both the Heterodyne (tone) processing filter *AND* the random noise filter. The audio becomes distorted.

A Ham from Louisiana offered the suggestion, that had been offered him and seemed to work well, that the unit would work OK if the operator would simply turn off their tranceiver's speech processor.

There followed a VERY heated argument about how the speech processing circuit processes OUTBOUND audio only and has NOTHING to do with the INBOUND audio going to the processor. However, when the (RF) Speech Processors were turned off, the DSP-9 (and DSP-59 and a few other brands as well) *ALL* responded as they were supposed to...

The question was immediately raised: "What could the (RF) speech processor have to do with the incoming audio?"

I speculated, and am seeking confirmation here, that the *RF* speech processor circuitry is engaged all the time the "compression" button is engaged, that unlike the final amp which is biased to cut-off, the speech processor runs, with no input, all the time. This would explain why the simple turning-off of the processor eliminates the problem, as does moving the DSP unit OFF the top of the radio and placing it a few feet away.

A glance at the block diagram of my rig and a quick look at the schematic seems to bear this hypothesis out, but I am still unsure and seek additional input and thought...

The real motive is: I have a DSP-9 that I intend to install in my mobile, but I have NO CHOICE about where to position the unit -- it MUST go right on top of the transceiver or not at all. I do NOT use a speech processor for a variety of reasons, but some of my co-pilots do...

So, anyone care to show me the error of my thinking? Confirm my wild-ass guess? Hit the "N"? Add me to the .killfile?

First of all, you're not supposed to "bother" the FCC until 90 days have
passed. Secondly, my license (Gen.) took 10 weeks and 5 days to arrive
back in December.

Keep in mind that Nov.-Dec.-Jan. is major holiday time for federal "workers"
and so everything slows down.

Patience.

Yes. It will be just like 100% amplitude modulation of 750Hz carrier with
a 50Hz square tone. Thanks for correcting me. I had lost sight of the
carrier. I was thinking of a DC square wave. Again, assuming that
the third harmonic is relevant for no ringing in the output, the minimum
bandwidth is 60Hz (for 20wpm). This is for no ringing in the output.

If one just considers the ability to copy a signal and accept ringing
provided that it permits copying of the signal, then
the minimum would drop. I have copied 20wpm signals while using a 30Hz
bandwidth FIR filter in the W9GR unit. There was lots of ringing but
I could still copy. The ringing could have been from insufficient
bandwidth or pinking of the noise by the narrow filter.

It may be that the fundamental is enough for copying but that more bandwidth
is needed to curtail ringing.

Well, if you absolutely MUST call and find out how it's going, the number
is 717-337-1212. They will generally be very nice about it, but remember
that any time spent gabbing about why your license isn't out yet will
detract from the ONE day a week that they run ham licenses.

No, there's no logging system up there, either, meaning that your appli-
cation sits in a big, FIFO stack until its turn comes up, and your
info is entered into the computer and printed up. Yes, this means that
if your license hasn't been printed, there is really no way of checking
(save for someone looking through the stack itself) to see where yours
is on the queue.

Yes, the system stinks. Yes, it needs a serious overhaul, which it is
probably getting in the next two years (instant licensing, electronic
applications, choice of callsigns, reduced waiting times...). Consider
that we're living "the old days." That should be some consolation in
a few years.

Patience is a virtue.

: receive.

: jerry

Wide receive is literal for all this class of radio, they tend to be very prove to losing the ability to hear an Amateur band signal when there are strong out-of band signals about. The only cure is having tight filtering around the amateur band, and this precludes wide range reception.

You'll not be far wrong if you think of them as a box containing 3 things:

1) a "scanner" with performance that places it at the cheap end of the scanner market, and less frequency coverage than usual.

2) A reasonable quality amateur band transmitter.

3) An amateur band receiver with only the performance of a cheap scanner, that is very susceptible to strong unwanted signals.

There are many people who have these and are delighted with them. Possibly due to being in areas away from non-amateur transmitters, or perhaps because they don't know what they've missed because they never heard it....

The Tandy hand-held may now be the only amateur hand-held that has not seriously compromised its performance as an amateur band radio.

I understand that some hand-helds now have computer game modes. Could they have been included to give the user something to do while in areas where blocking is frequent?

Ok, I've got strong opinions in this area, but if scanning was your prime interest, you probably wouldn't have got a licence.

If you can't hear 'em, you can't work 'em. whoever said it first is probably long dead, but it is still true. Also don't you just always lose contact just at a critical point in a talk-in etc.

Cheers
David

763. HAM licence and after

Newsgroup: rec.radio.amateur.misc

Hi all,
I am going to take the Ham test _basic , tomorrow. now i was wondering and want some advice on what type of radio should i get and what make, what should i be looking for in a handheld, what price is good for a beginner, etc, after i get my licence. i can only work above 30MHz as you all know, so i was thinking of a dual bander - 2m and 70cm handheld. is this a good choice, or what else will you sugggest. at the moment , more important is the price range i am going to be loooking at for a reasonable set.
For the set that you suggest where can i get it in Toronto.

Thanks in advance you your much appreciated advice to this (hopefully) very new Ham op.

mail me if possible to :

cs922150@ariel.cs.yorku.ca

Thanks

Recently liberated from our corp. lab, what appears to be a VHF
Transceiver. Rig was built by Sideband Technology Inc. of Scottsville
N.Y. Model number is the ACSB Pioneer 1000. Appears to be a 4 Channel
Xtal controlled with Xtals for 154.450 Mhz. Looks like a straight forward
VHF rig from the Main board, but underneath is another board chock full of
chips in what appears to be the audio section.

Anybody any info on these rigs? Would love a manual or even a schematic.

Regards

In article <2i3fsu$7lh@news.acns.nwu.edu> rdewan@casbah.acns.nwu.edu (Rajiv Dewan) writes:

If we broaden the definition of ringing to allow for noisy signals, of
the kind encountered on the low HF bands such as 80m, then there might
be more than one source of ringing:
. . .
2. Progressive coloration of background white noise as the filter
bandwidth is narrowed. . . .

You've nailed the head on the hit as far as I'm concerned, especially
on the low bands. As I narrow the digital filter (the built-in audio
filter on the Yaesu 990) to eliminate QRM the noise acquires a pitch
which obscures the tone I'm trying to distinguish. If only there were
some way (maybe there is! I'm no expert with using the RF gain
control, for instance) to desensitize the receiver to the noise without
desensitizing it to the weak CW signal.

Concurred. It will come _eventually_. If it does not come within 90
days after the test date, call the ARRL VEC before you call the FCC.
They can verify when the FCC received the paperwork, and may advise
you to wait to call the FCC.

767. How to "Convert" Ham Radio HyperCard Stack?

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-27 19:09:45 UTC
From: Daniel.W.Collison@dartmouth.edu
Message-ID: <2i93hp$fj4@dartvax.dartmouth.edu>
Source record: 271831
Cross-posted to: rec.radio.amateur.misc,comp.sys.mac.hypercard

There's an easy solution. You're right, it does have to do with the fact that you're using HyperCard (2.1), which is a newer version than was used to make the original stack.

All you have to do is choose "Convert Stack" from the "File" menu. If the "File" menu isn't visible, type the "Apple" key and the spacebar at the same time to make it show. If you still have trouble, send me E-mail and I'll help out.

768. rsgb gb2rs news 30th jan

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-27 19:15:30 UTC
From: ted@tedb.demon.co.uk
Message-ID: <759698130snz@tedb.demon.co.uk>
Source record: 271829
Cross-posted to: rec.radio.amateur.misc,uk.radio.amateur

Good morning. It's Sunday the 30th of January and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- The RSGB has a new Executive Vice-President and a new Membership Liaison Committee Chairman; RadCom was due to be posted to RSGB members last week; and attention all those running Thinking Day stations.

Clive Trotman, GW4YKL, is the RSGB's Executive Vice-President for 1994. He was elected by the RSGB Council at its January meeting. In order to carry out the EVP's duties, Clive has relinquished the Chairmanship of the Membership Liaison Committee (MLC). The new MLC Chairman is Peter Sheppard, G4EJP, who is the Zonal Council Member for the North of England. The RSGB's Membership Liaison Committee deals with matters concerning the Society's service to members, including the Liaison Officer (RLO) scheme, the GB2RS news bulletin and Morse practice transmissions.

The Guides Thinking Day on the Air will take place during Saturday the 19th and Sunday the 20th of February. A list of participating British GB Stations and of countries permitting Third Party Greetings Messages for this event is available from the RSGB Headquarters on receipt of a Self Addressed Stamped Envelope, size A5 or larger. The address is: RSGB Lambda House, Cranborne Road, Potters Bar, Herts, postcode EN6 3JE. Please mark the envelope 'TDOTA 1994 List'.

The February edition of Radio Communication (RadCom) has been posted to all RSGB members. It contains the full text of the speech made by the new RSGB President Ian Suart, GM4AUP. There is also a letter from the Portuguese AMSAT organisation explaining the negotiations which will lead to PO-SAT OSCAR 28 becoming available to the Amateur Satellite Service.

Next Tuesday, the 1st of February, marks the official opening of the amateur radio station of the South-East Essex Sixth Form College in Benfleet, Essex. It will be attended by the Principal, Governors, local press and radio, with the formal opening being performed by Jeff Stanton, G6XYU, whose company has been associated with amateur radio work at the College for several years. The callsign is GX7PRU, and it represents the culmination of work within the College by George Brown, G1VCY who teaches Electronics and Physics there. Amateur radio is now assuming a high profile within the College, and it is intended to integrate it into the curriculum at the earliest possible time. Any contacts with the station will be welcomed, particularly those with other schools, the packet radio address is GX7PRU @ GB7DUG and all messages will be answered by students at the College.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Antarctica, LA9YBA is signing 3Y9YBA

now, from the Tierro Mountains region, in Zone 13. Check 10.102MHz around 0100 UTC. From Aruba, K4PI will sign P49I from now until Tuesday the 1st of February, taking in the CQ WW 160m CW Contest. From St Peter and Paul Rocks, the callsigns PY0SP and PY0SK will be aired by a group of Brazilian amateurs from Tuesday the 1st of February for two weeks. Activity will be on all bands from 160 to 6 metres on CW, SSB and RTTY. From Kenya, 5Z4JD will be especially active on the 160 metre band in the coming weeks.

Rally news now and we have one/two events this week:

Fenland Repeater & Lincs Packet Groups Junk Sale and Rally is being held at the Horncastle Youth Centre, Horncastle, Lincolnshire. The event starts at 10.30am, with talk-in on channel S22.

The fourth Lancastrian Rally is being held at the University of Lancaster. Doors open at 11.00am, or 10.30 for disabled visitors. The rally features many trade stands and a bring and buy stall.

We know of only one rally for next Sunday the 6th of February:

The South Essex Amateur Radio Society Radio Rally is to be held at The Paddocks, Long Road, Canvey Island, Essex. This is at the end of the A130. Doors open at 10am. The disabled visitors' parking area is near the main door entrance. The event features trade stands and a bring & buy stall. Refreshments will be available and talk-in will be on two metres, channel S22. Further details can be obtained from Ken, G0BBN on 0268 755350.

Next some dates for your diary:

The 1994 RSGB VHF Convention is to be held at its usual venue, Sandown Race Course, Esher, Surrey on Sunday the 20th of February. See January's RadCom for full details of the comprehensive lecture programme. Note that this event is being held much earlier in the year than usual.

The 1994 RSGB London Amateur Radio and Computer Show is to be held during Saturday the 12th and Sunday the 13th of March, at the Lee Valley Leisure Centre, Picketts Lock Lane, Edmonton, London. This is the usual venue, but with a new name. The February RadCom contains full details of the comprehensive lecture programme. This event is being run by RadioSport Limited, in conjunction with the RSGB and the Southgate Amateur Radio Club. There will be no RSGB National Convention this year so the Society will be putting on a larger stand at the London Show.

HF contest news now:

The results of the 1993 RSGB SSB Field Day have been published. Open Section winner is the Lichfield 'A' Station, G3WAS/P, with 864,960 points. Lichfield's 'B' Station is runner up. Restricted Section winners are Plymouth Radio Club, G3PRC/P; second is Torbay Amateur Radio Society. A photograph of Lichfield's winning station appears on the cover of the February RadCom, and the full results can be found on page 82. The ARRL CQ Worldwide 160m Contest takes place this weekend, it started at 2200 UTC on Friday, and finishes today Sunday at 1600 UTC. The last of the RSGB LF Cumulative events take place

during the next few days. An 7.0MHz Cumulative takes place today, Sunday the 30th and again on Saturday the 5th of February. Both run from 1000 - 1200 UTC. The RSGB LF Cumulative 1.8MHz Contest in the current series is next Friday the 4th of February from 2000 - 2200UTC. The RSGB LF Cumulative 3.5MHz Contest takes place next Sunday, the 6th of February, from 1600 to 1800 UTC. December's RadCom, page 84, gives detailed information on all of these LF Cumulative Contests.

Next some VHF contest news:

February's RadCom contains the results of the RSGB 70MHz Trophy Contest. The single-operator winner is G3KSR with 23,422 points from 78 contacts. The Open Section was won by GM4DSP/P with 49,320 points from 80 contacts. Best DX was GM4DSP/P to GJ6MXL/P at 647km. The second event in the RSGB 70MHz Cumulative Contest is today, Sunday the 30th from 1000 to 1200 UTC. There are three sections:- Fixed station single operator, Open and Listeners. The RSGB 432MHz Fixed, AFS and Listeners Contest takes place next Sunday, the 6th of February, from 0900 to 1500 UTC. There are three sections:- Single operator fixed, Multiple operator fixed and Listeners. See December's RadCom page 83 for details for both of these VHF events.

The results of two Direction Finding contests have been published in the February RadCom. The Ripon and District Qualifying Event was won by Mr A Mead of the Colchester DF Club, and the Torbay HF Qualifying Event was won by Brian Bristow of the Mid-Thames DF Club.

Special event stations this weekend include:
GB4CAA, County Air Ambulance, operated by members of the West Bromwich Central Radio Club in aid of the Country Air Ambulance appeal in concert with thirteen other through the Midlands. The station is located at the The Sandwell Hotel, High Street, West Bromwich and will be operational on HF, VHF and UHF from 10am to 5pm, throughout this weekend. Visitors are very welcome to visit the station. The other Air Ambulance appeal stations are listed in January's RadCom. GB4FFL, Fight For Life, is run by members of the Salop Amateur Radio Society in support of the Air Ambulance appeal. The station is operational from a site near the old Control Tower at Condor Airfield, Shropshire and will be on the air from 9am to 6pm, during this weekend. All are welcome to visit the station.

And now the solar factual data:

The period from the 17th to the 23rd of January has seen little solar activity and no flares of any note. The recent spate of geomagnetic activity has now died down. The sunspot indices steadily rose over the period, from 34 on the 17th up to 105 by the 23rd. The mean level was at about the 70s. Solar flux levels have not changed much and averaged 108 units. The geomagnetic Ap index was very unsettled up to the 19th, being up to sub-storm levels of 27 units on the 18th. Activity then declined to quiet levels and was only 5 units by the 23rd. The period averaged an Ap index of 17 units. The state has been 'nil, nothing to report' throughout the period. The aa indices, as reported by the British Geological Survey for the period from the 11th to the 17th of January, saw daily averages of around 42.3 nanoTeslas, about K4 - which is very

unsettled. There was little variation day to day. The only very disturbed period was late on the 11th with 6 hours at 101 nanoTeslas, about K5. The X-Ray Flux has generally declined from B4.6 on the 17th down to B1.8 by the 20th. It averaged B2.4 units for the period.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers as reported by Meudon averaged 8.1MHz, though levels increased with the decline in geomagnetic activity from 7.9MHz on the 17th up to 9.0MHz by the 23rd. The daily highs are now between 12.00 and 14.00 hours. The darkness hour lows averaged 2.5MHz and hardly varied day to day. They are centred about 06.00 hours.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg averaged 7.1MHz, and the darkness hour lows averaged 2.2MHz. The availability of solar data is continuing to decline, the Penticton observatory that now records the world standard of solar flux has now decided to delete the daily 2,800MHz east/west solar scans which showed where the active regions were. The new soft X-Ray telescope images recorded by the Yohkoh satellite. A co-operative effort by the USA, the UK and Japan has replaced this data with full solar disc pictures.

And lastly the solar forecast:

This week, the active side of the sun will be rotating away, solar flux levels are expected to be about 100, though the 90 day mean on the 23rd was 102. The geomagnetic activity is expected to be quiet around an Ap of 5. In the south the daylight MUFs are expected to be about 24MHz and the darkness hour lows about 7.5MHz; for the north, levels will be lower.

And that's the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 U J and G7 R O series, and Novice calls in the 2 0 A H and 2 1 C M series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Next, the local news.

NEWS FOR THE SOUTH EAST

First, news of a new group newly formed in Kent - the Kent IP Group. Anyone who is interested in joining this group is asked to contact the Chairman, Chris, G6AHK on 0892 822849, for further details.

Meetings for Tuesday the 1st of February:

Chelmsford Amateur Radio Society has a talk entitled 'Cellular Communications - Part 1' by Colin, G4IIK. Further information from Charles, G0GJS on 0245 256654.

Solent Amateur Television and Radio Club meets for its Annual General Meeting and a Surplus Equipment/Junk Sale. For further details contact Kerry, G6CPE on 0794 514811 or Alan, G1APD on 0703 476029.

Stevenage and District Amateur Radio Society has a 'Hints and Tips - a Round Robin Help-Line evening. Take along your ideas. Details from Neil, tel: 0438 350882.

Meetings for Wednesday the 2nd of February:

Aylesbury Vale Radio Society has a talk on 'Foreign QSOs' by Liz, G0ETU. For further details contact Martyn, G4XZJ, on 0296 81097.

Chesham and District Amateur Radio Society has a Discussion Evening. For further information contact Ian, G0RTF on 0494 676391.

Dover Radio Club has a 'Novice Evening'. For further details of the club's activities contact Mick, G7NOR on 0304 825030.

Three Counties Amateur Radio Club has a talk on 'Amateur Astronomy' by John Smith. For further details contact Tom, tel: 0428 606298.

Worthing and District Amateur Radio Club has a Discussion evening. For further details contact G4GPX on 0903 753893.

Meetings for Thursday the 3rd of February:

Cray Valley Radio Society has a talk on 'Fine Tuning a DXpedition' by Bob Treacher. For further information contact Bob on 081 850 1386.

East Kent Radio Society has a talk entitled 'TV from the Goodwin Sands' by Brian, G8ZYZ, at Parkside. For further information contact Paul, G3VJF on 0227 364606.

Hoddesdon Radio Club has a Video entitled 'North Sea Trawler'. For further details contact Roy, G4UNL, on 081 804 5643.

Horndean and District Amateur Radio Club has a Junk Sale, starting at 7.30pm. Details from Stuart, G0FYX, tel: 0705 472846.

Horsham Amateur Radio Club has a talk on 'Amateur Radio 1949 Way' by Brian, G3GDU. Contact Peter, G8SUI on 073784 2150 for further details.

Maidenhead and District Amateur Radio Club has a talk entitled 'What has happened at the RSGB recently' by Council Member Neil Lasher , G6HIU. For details contact Neil, G0SVN, tel: 0628 25952.

Shefford and District Amateur Radio Society has a Members' Activity night. Contact Paul, G1GSN on 0462 700618 for further details.

Vange Amateur Radio Society has a Junk Sale. Contact Doris on 0268 552606 for further information.

Meeting for Friday the 4th of February:

Loughton and District Amateur Radio Society has a talk/demonstration on 'Using an Oscilloscope' by G3OPA. Call G8DZH on 081 508 3434 for details.

NEWS FOR SOUTH WEST

Meeting for Monday the 31st of January:

RSGB City of Bristol Group has a talk entitled 'Portishead Radio' by Larry Bennet. Contact Dave, G4NKT on 0272 62124 for further information.

Meeting for Tuesday the 1st of February:

Salisbury Radio and Electronic Society has a talk on 'A Radical New Licence Procedure' by G7GWF. Details from David on 0722 330971.

Meetings for Wednesday the 2nd of February:

South Bristol Amateur Radio Club has a 10 Metres Activity Evening. For more information telephone 0275 834282.

Trowbridge and District Amateur Radio Club has a Surplus Equipment and Silent Key Sale. Contact Ian, G0GRI on 0225 864698 for further information.

Meeting for Thursday the 3rd of February:

Yeovil Amateur Radio Club has a talk entitled 'The Worked All Britain Awards' by G1THG. Contact Cedric, G4JBL on 0258 473845 for further information.
Meetings for Friday the 4th of February:

Saltash and District Amateur Radio Club has a Computer Night with a talk and demonstration by Andrew and Phil. For further details contact Brian Giles, tel: 0752 844321.

Taunton and District Amateur Radio Club has a discussion on "The G5RV Antenna" led by Graham, G0GTR. Details from G3WNI, on 0823 680778.

NEWS FOR EAST ANGLIA

Meetings for Tuesday the 1st of February:

The Amateur Radio Club of Fakenham has an HF Open Forum. Contact Dave on 0485 528633 for further details.

Leiston Amateur Radio Club has a talk on 'Communications in Space' by Professor John Allen, at the Sizewell Sports & Social Club. Details from Bob, G0HSI on 0986 874800.

Sudbury and District Radio Amateurs has a talk on 'Measurements in the Shack' by Frank, G3FIJ. For further details contact Tony, G8LTY on 0787 313212.

Meetings for Wednesday the 2nd of February:

Ipswich Radio Club has a talk and film show entitled 'Poland' by Dr Grazyna (pronounced Gratzina). Call Sheila, G8HYE on 0473 742072 for details.

Martlesham Radio Society has a talk entitled 'Radio Experiences Abroad' by Dave, G4FRE/WG3I. For an entry ticket and further details contact Darren, G7BKO on 0473 227332 (office hours) or 0473 610601 (evenings).

Norfolk Amateur Radio Club has an 'NARC Film Archive Evening' with Jack, G3NJQ. For further details contact Sheila, G0KWP on 0603 618810.

Meeting for Thursday the 3rd of February:

Yarmouth Radio Club has a Junk Sale. Contact Tony, G3NHU, on 0493 721173 for details.

Meeting for Friday the 4th of February:

Cambridge and District Amateur Radio Club has a talk entitled 'Drive by Wire'(Modern Engine Management Systems) by Murray, G0PFG. Visitors welcome. For further information contact John, G0TIL on 0763 243570.

NEWS FOR THE MIDLANDS

Meetings for Tuesday the 1st of February:

Loughborough and District Amateur Radio Club has a talk entitled 'Audio' by Barry, G0LCU. For further details contact G8SNF by telephoning 0509 218259.

Grantham Radio Club has a talk on 'Sine Waves, Decibels and Falling off Logs' by Mike, G3PJR. Contact John, G8WWJ, 0476 65743 for further details.

Meetings for Wednesday 2nd of February:

Derby and District Amateur Radio Society has a Surplus Sale. For further details contact Hayley, G7PXA on 0773 856904.

South Birmingham Radio Society has a talk entitled 'Present Day Receivers' by Gordon, G3LEQ. For further details contact Roy, G8ACR on 021 474 3784.

Telford and District Amateur Radio Society has an 'Equipment Night'. For further details contact Dave, G4EIX, on 0952 588878.

Meetings for Thursday the 3rd of February:

Cannock Chase Amateur Radio Society has a talk on 'Radio Control of Model Aircraft' by John Duller. Contact Eric, G4ICE on 0543 502836 for details.

Vale of Evesham Radio Amateurs Club has a Magazine Swap night. For further details contact Alasdair by telephoning 0386 41508.

Meeting for Friday the 4th of February:

South Notts Amateur Radio Club has a Junk Sale. For further information contact Julie, G0SOU on 0602 216342.

Meeting for Sunday the 6th of February:

Charnwood Amateur Radio Contest Club has a discussion on 'Antennas for 160 Metres'. For further details telephone 0509 232927.

NEWS FOR THE NORTH OF ENGLAND

Meeting for Monday the 31st of January:

Sheffield Amateur Radio Club has a Construction night, organised by Roy, G0NRM. Further details from David, G0JJR Tel: 0742 446282.

Meetings for Tuesday the 1st of February:

Liverpool and District Amateur Radio Society has a discussion on Licensing Interpretation. Further details from Ian, G4WWX who is QTHR.

Mid-Cheshire Amateur Radio Society has a Construction night. Contact Mike, G7LQD on 0606 331210 for details on future activities and Morse/ RAE classes.

Wakefield and District Radio Society meets for a talk on 'Bits and Bobs' by Bob, G3WWF. Further details from Roy, G0TBY on 0924 893321.

Meetings for Wednesday the 2nd of February:

Denby Dale Amateur Radio Society has a talk entitled 'A Day in the Life of the Wakefield Coroner' by David Hinchliff. Details from G3ABS on 0484 606542.

Wirral Amateur Radio Society has a talk on 'The History of Transport in Wirral' by Glyn Parry. Further details from G3FOO, tel: 051 644 6094.

Meetings for Thursday the 3rd of February:

North Wakefield Radio Club has a Grand Surplus/Junk Sale. Booking-in starts at 7.30pm and the sale starts at 8pm. For further information contact John, G4RCG on 0924 362144.

Spen Valley Amateur Radio Society has a 'Construction Clinic'. Take along your Projects. For further details contact David, G1CTO on 0924 497767.

Trafford Amateur Radio Club has a talk on 'Introduction to TCP/IP' by Terry, G0CRF. For details contact Malcolm Collis on 061 748 8046.

Meetings for Friday the 4th of February:

South Manchester Radio Club has a talk on 'Zulus, part 2' by G0BJK. For further details contact Edward, G7FQY, tel: 061 969 1964.

Stockport Radio Society Computer Group has a talk on 'Turbolog' by G0JQI. For further details telephone 061 439 4952.

NEWS FOR SCOTLAND

The Grampian Repeater Group announces a new UHF Repeater, GB3BA on Channel RB1, opening today, the 30th of January at 1500. This Repeater is located at Durris, near Banchory, and is sited to cover the area South West of Aberdeen including Culter, Banchory and Stonehaven. Reports would be most welcome and should be made to GM4ZUK who is QTHR.

Meeting for Tuesday the 1st of February:

Dundee Amateur Radio Club has a lecture entitled 'Oliver Heavyside' by Leslie, GM0TGG. Details from GM4FSB who is QTHR.

Meeting for Friday the 4th of February:

Aberdeen Amateur Radio Society has a Junk Sale. Details from Gordon, GM7PXW who is QTHR.

NEWS FOR WALES

Meetings for Thursday the 3rd of February:

Meirion Amateur Radio Society has a video from the Smithsonian Institute entitled 'The Universe'. Contact Maurice, GW3GKZ on 0341 422447 for details.

Swansea Amateur Radio Society has a talk on 'Weather Satellites Picture Reception' by Graham, GW3SIY. For further details contact Graham, GW3SIY, on 0792 403527.

NEWS FOR NORTHERN IRELAND

Meeting for Friday the 4th of February:

Bangor and District Amateur Radio Society has a Construction evening with Crawford, GI0EZD. The venue is Room A13 (ground floor), Bangor Technical College and the start time is 8pm. For details contact Keith, GI0SSA on 0247 883315.

And that's the end of this week's GB2RS news broadcast, which was prepared by the Radio Society of Great Britain.

769. FCC form 610-V

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-27 19:21:39 UTC
From: Greg@epitome.er.doe.gov
Message-ID: <2i9483$n3c@cronkite.nersc.gov>
Source record: 271836

In the FCC announcement regarding vanity callsigns, they stated that every application for a specific callsign would have to be made on a form 610-V. I called the FCC in Washington and they said no such form exists. Knowing our government, it probably will take a year or two to design one, and another year or two to have it approved and printed in quantity.

Does a form 610-V already exist in some dusty government warehouse?

772. Is portable radio use possible in remote wilderness areas?

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-27 20:14:29 UTC
From: ph600fgr@sdcc14.ucsd.edu
Message-ID: <60254@sdcc12.ucsd.edu>
Source record: 271848

I do much backpacking, and increasingly I go alone. I'm thinking about the possibility of bringing a communications radio with me. Do these things have a large enough range to work out in the wilderness? I typically find myself only in California.

What's the cost involved, and how big are the radios?

The December, 1993, issure of Physics Today, published by the American Institute of Physics, has an article about Russell Hulse and Joseph Taylor, who recently received the Nobel prize in physics for their discovery of the first binary pulsar. Near the end of the article, Hulse is quoted: "I came to ham radio by way of radiotelescopes. In Joe's case it was the other way around."

Interesting, too, was the fact that Hulse "is the fifth graduate of the Bronx High School of Science to win the Nobel Prize in Physics."

Ahhh, I remember them - a little. I used to live in Rochester and they
were building them out on the west side of the city. I believe they are
Amplitude Compandored SSB rigs for VHF. Supposed to replace NBFM rigs
with closer channel spacing but still the simple channelised tuning (and
I think some autotuning with a pilot carrier suppressed -24 db or so)
I think this was the same kind of technology that UPS was supposed to
put into place in the 220-222 mhz region, but I guess it wasn't working
out that well. Not sure about the status of the company now. I'd be
curious about more info too. I think you can find some treatment of
ACSSB in the mid 70's-80's ARRL handbooks.

The ACSB means amplitude compandored side band. Not exactly the same
thing as a "normal" VHF-FM rig. Best used to talk with other ACSB
rigs.....

|> Is Yellowstone served by one or more repeaters? Does any repeater offer
|> coverage of much, most or all of the park?

Yellowstone is mountainous terrain, with significant ranges between the park and any other major population area. The result is that there are no amateur radio repeaters reachable from inside the park. The only activity I've ever heard has been on 146.52 simplex. In the summer, the fire lookout on Mt. Holmes, who is a ham, is often heard on that frequency.

There are park service repeaters galore, of course, on several peaks in the park, such as Mt. Holmes and Mt. Washburn. Attempts to get the Park Service to allow an amateur repeater on any of these hilltops have met with failure.

There is only one way to find the answers to these questions. Go to the induction. You might also check up on some of the older issues of QST for some of The Old Man's (T.O.M.) editorials. He explains some of the reasons for the Royal Order of the Wouff Hong. However, you got go to the induction to be a true member of the order. Have fun and enjoy yourself, if you always knew what was going to happen life wouldn't be any fun.

BTW, the early issues of QST are early 30's and earlier. Better check a good library.

This sounds like one of the test rigs for Amplitude Compandored Single SideBand. This is the mode UPS was going to use in taking over the 220-222 MHz spectrum before they decided to go with cellular phone, but after we lost the spectrum.

It's basically a single sideband radio with the audio compandored with a 2:1 compandor like dbx, and with a pilot tone injected for compandor tracking and AFC. It was supposed to give FM convienence in an SSB bandwidth. If you strip out the compandor and the pilot tone generator, you can move it to 2 meters where it can serve as a 4 channel SSB rig. Probably not worth the effort though.

Jeff-

The band hasn't been so good lately. Yes, you will find nets and clubs. For example, the Titusville, Florida, Amateur Radio Club sponsors a "Mosquito Net" on 28.333 MHz. They meet at 7 PM Eastern time, on Wednesdays. You can check in, and be assigned a "stinger number", for what its worth! Club members are frequently found on that frequency at other times.

A second "chapter" of the Mosquito net, is now operating in Orlando, Florida, on Tuesdays at 7 PM Eastern.

Of course, there is the granddaddy of all the ten meter nets. The "Ten-Ten International" club has regional nets, as I understand it. However, I don't have any better information. Membership to Ten-Ten requires contact with ten current members. You collect their "Ten-Ten Numbers", and send a copy of your log to the regional coordinator, along with some nominal registration fee.

I suggest you try calling "CQ Ten-Ten". Others more active than I, can give you information on how to get your own number.

What do you do with a Ten-Ten number? You exchange them! There are awards for various categories, depending on how many numbers you have collected. The purpose of the club is to promote Ten Meter activity.

73, Fred, K4DII
Mosquito Stinger #186
Ten-Ten #2579

>What's the cost involved, and how big are the radios?

There are a couple of types of amateur radios you might consider,
with the appropriate licenses of course. The first type is a VHF,
or UHF, or VHF/UHF handheld FM voice radio commonly called a HT by
amateurs. *If* there is a mountaintop repeater within your line of
sight, and there are many in California, you should be able to have
communications in the back country. Without a repeater, your signals
will normally be of limited range, basically no more than 3-5 miles
unless you are in a particularly favorable location. If you're on
a mountaintop, your range may extend out more than 100 miles. That's
why repeater stations are placed there. Usually you'll find someone
monitoring the repeater frequency around the clock. Power demands
for these handheld radios are modest, they're tiny, and antennas are
small. Name brands are Radio Shack (surprisingly good), Icom, Yaesu,
Kenwood, Alinco, and Standard. Prices run from $300 to $600 for new
radios, batteries, and other accessories. A Technician or higher class
amateur license is required.

The other type of radio that you might consider is a small SSB/CW
radio operating on the HF (High Frequency) spectrum. With the proper
choice of time of day, frequency, and condition of the Sun, the
ionosphere can act as a sort of repeater, refracting your signals
back to Earth at distant points. This can lead to worldwide
communications, though not to all points at once. Using the Earth's
natural repeater frees you from the restriction of being within line
of sight of an actual repeater, but it brings along a host of problems,
or challenges depending on how you look at it, of it's own. You must
develop an understanding of the factors influencing propagation. You
must become aware of different propagation modes, and you must keep
informed about the state of the Sun. There are few commercial radios
suitable for backpacking, antennas are large, and prices run from
$500-$5000 depending on how elaborate a radio you want. Some amateurs
use small home built CW radios. Others use so called QRP radios from
Ten-Tec, Yaesu, and (with modifications) from Icom. Radios are generally
bigger than the HTs, typically like a fat shoebox. Antennas, while
large, can be made of wire and thrown over convienent supports on
site. These aren't radios that you would normally be able to use while
on the move on foot. There are a couple of limited availability choices

for on the move HF. A company makes a handheld SSB radio for single band use. It's imported in limited numbers under different names. While fun to use, it probably shouldn't be counted on for reliable communications. The second choice is one of the various military manpack radios. These sometimes show up on the surplus market. They're bigger and tougher than the other choices, but make quite a load for a backpacker by themselves. To use any of these radios on any band aside from 10 meters, a General Class license or higher is required. Limited 10 meter voice operation and small CW segments are available with just a Technician plus Morse Code or Novice license. 10 meters generally isn't suitable for the medium range type of communications you're likely to want, it has wide "skip zones", but it does ocasionally offer long range contact possibilities with low power. HF is not channelized operation, and it's often difficult to reach someone at a specific location unless prearrangements are made.

So your amateur choices are VHF/UHF or HF. The former is better for reliable emergency communications provided you'll be in range of a repeater. The latter is the only thing if no repeater is available, but is erratic at best due to changing propagation, lack of standard channels being monitored, bulk of equipment, and the extra operator knowledge and skills (on both ends) required to use it effectively.

There is a third way that I haven't mentioned, amateur satellite operation. VITA demonstrated that a briefcase sized station can reliably send Email via Microsat from locations far in the bush. While I haven't heard of backpackers doing this routinely, there's no reason you couldn't use this method to keep in touch. Communications windows are fairly short, about 10 minutes each, and only when a Microsat is above your local horizon, about twice a day for a given satellite, but the method should be very reliable and predictable. You need small VHF/UHF radios, a TNC, and some sort of display and keyboard device, an HP95LX will work. Antennas are modest. A Technician or higher license is required.

Whatever radio system you choose, carry a solar panel to recharge the batteries if you're going to be out for more than a day.

Gary

Has induction to the royal order always been open, or was it at one time
"by invitation only" ?

thanks,
Dan

: What's the cost involved, and how big are the radios?

You can usually "work out in the wilderness", but your question is
rather vague. Are you a ham? Do you want two-way communications?
Do you want world-wide communications or just local capability for
emergencies? If we had a clue, we could help you! ;-)

Thanks to Don and the other folks who told me that command-spacebar would
allow me to access the menubar, and thereby Convert the stack. It worked!

NOTE: The Effective Sunspot Number for 26 JAN 94 was 56.0.
The Full Kp Indices for 26 JAN 94 are: 1+ 3o 5- 3- 4- 4- 3o 2+

SYNOPSIS OF ACT

Solar activity was at moderate levels. A M2/1B flare
erupted from Region 7654 (N07W78) at 0510UT. An unassociated
Type II radio emission was detected at 0401UT.

Solar activity forecast: solar activity is expected to be
at low to moderate levels until Regions 7654 and 7658 (N11W53)
depart the disk.

The geomagnetic field has been at quiet to active levels
for the past 24 hours.

Geophysical activity forecast: the geomagnetic field is
expected to be at active levels through the remainder of the
27 January. Quiet to unsettled levels are expected for the
remainder of the forecast period.

Event probabilities 28 jan-30 jan

Class M 45/45/45
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 28 jan-30 jan

A. Middle Latitudes
Active 20/10/20
Minor Storm 10/05/10
Major-Severe Storm 01/01/01

B. High Latitudes
Active 20/10/20
Minor Storm 10/05/10
Major-Severe Storm 01/01/01

HF propagation conditions were normal over the low and
middle latitudes. High and polar latitudes saw occasional
minor signal degradation during the local night hours due.
Near-normal propagation is expected over all regions during the
next 72 hours, particularly for the low and middle latitude
paths. High and polar latitudes should see gradual
improvements as well. Brief SWF activity is still expected at
times over daylit circuits during minor solar flare activity.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

> Harold
> hpeach@ca.uky.edu

Hi Harold,

The article was "Persistence Gets the Derelict" (QST, August 1993, p35)
about our Edge of Space Sciences (EOSS) sixth balloon flight that we
launched near Denver but which took off for Nebraska.

Paul Ternlund, WB3JZV created the Macintosh PowerBook Excel program to
track the balloon's position as determined by the radio
direction-finding tracking team. Paul's phone is 303-699-7479 and his
email address is paul.ternlund@filebank.com .

That was EOSS-6 in May 1992, when we were experimenting with VOR
reception on the balloon. Since then we have had several successful
Loran-C balloon payloads with AX.25 packet telemetry and sponsored a
National Balloon Symposium. We hope our next EOSS-15 in February will
provide our first onboard GPS receiver AX.25 telemetry.

Sorry to post this here, but I got no responses on the CB group...bear with me.

I have a couple of questions about a CB problem. I have an ancient SBE Brute CB which I inherited. I purchased a new antenna, and hooked up the thing to an SWR meter.
1. For one thing, the connectors between the antenna and coax don't lend themselves to SWR-meter hookup. I hooked up the meter between the radio and the coax. Is this useless? Does it have to go between coax and antenna?
2. Also, thanks to some substance (syrup, honey, tar...) on the mic button, the radio got stuck on transmit whilst I unhooked the SWR meter. A minute later, I smelled that telltale smell, and noticed that the chassis was hot. What is likely to have been damaged? The measured (A la #1) SWR reading was somewhat lower than before, but the radio still seems to work. Is this something I can fix? What should I replace? Is this living fossil worth it? Any suggestions are much appreiated.

73 from a STILL un-callsigned guy, George

Close, it has 16. I have a HTX-202 and it is one sturdy radio. I've dropped it several times (once while coming out of the attic after installing a 2M antenna) and have had no problem with it. I love my brick and would not trade it in for anything! It is great for packet, with the mag-mount antenna it goes moble, and with a simple 1/4 wave ground plane antenna it's a base station. When I use a 12v regulated power supply, I get almost 9 watts out on high. It is definitely worth it.

just my humble 2 cents worth.

Archive-name: radio/ham-radio/hams-on-usenet/part1
Last-modified: $Date: 94/32/28 05 32$
Version: $Revision: 1.03 $

I would be pleased to take any e-mail updates to this list, preferably at
hams-on-usenet@ve6mgs.ampr.ab.ca. I have split this list into six parts. This
First part contains primarily European calls with US call district 0.

The index of parts:
Part 1 contains 4x1bq through wa0zvi
Part 2 contains nv1a through ka2zvz
Part 3 contains wn3a through kc4zwi
Part 4 contains kj5aa through kd6zwi
Part 5 contains aa7a through wa9zxm
Part 6 contains oa4hv through zs6tw

Ciao, 73 de VE6MGS/Mark -sk-

# Network address to name or call letters lookup table maintained by
# Mark Salyzyn VE6MGS mark@ve6mgs.ampr.org
#
# Only posting entries less than 12 months old (three terms at most educational
# institutions) in the interest of bandwidth savings. The entire list is
# accessible at the ftp sites and via the email server in any case.
#
# Please send corrections/deletions/additions hams-on-usenet@ve6mgs.ampr.ab.ca
# (if unreachable, mark@ve6mgs.ampr.org or adec23.UUCP!mark is ok). Many
# additions and updates are generated by collecting postings to the
# rec.radio.amateur.* hierarchy, so keep that in mind when requesting
# additions. Australian Amateur Radio Operators may prefer to mail their updates
# to Dean Davidson <ddavidso@metz.une.edu.au>. Any person interested in handling
# regional versions of the list are invited to drop me a note, I am
# particularily interested in representatives of non-english speaking regions
# so as to increase the accessibility of the list.
#
# archived for ftp @ ftp.cs.buffalo.edu:hams_on_usenet courtesy of
# Devon Bowen KA2NRC <bowen@cs.buffalo.edu>
# also ftp @ grivel.une.edu.au:pub/ham-radio/aus.radio/lists/internet.hams
# courtesy of Dean Davidson <ddavidso@metz.une.edu.au> for Australian hams.
# Canadian and US call sign lookups courtesy of the QRZ HAM Radio CDROM and
# thus thank Fred Lloyd <flloyd@qrz.com> for his efforts.
#
# email `grep' server reqnet@ve6mgs.ampr.ab.ca in the body of the message put
# a `lookup string ...'. email response limited to 10K. if you want to specify
```

a return address, add optional `return user@host.domain'. For example:
Subject: Could be anything (sure!)
return wabbit@it.was.a.tewibble.storm.edu
lookup ka2nrc ve6tcp nm1d elmer
#
Last update January 28 1994
#
This document may be distributed freely, as long as there is no financial
gain. I do not condone this list being used for generating junk mail or
other annoyances as this is not the purpose of the list. If you are in this
list and wish to keep your entry hidden, or that the name I have here be
changed (My middle name is Gregory and I am **** proud of it :-), I would
oblige.
#
Entries have this format (-> denotes separated by at least one tab):
Address (Name) -> Call -> Date
#
Address
Network address popularily used by individuals on the network. Although
the address that many news posters add may be incorrect, personal
e-mail contacts or updates are always placed first in the list of
duplicate calls. Removal of entries is by complaint only, so some
(mainly .EDU) may be invalid over time. For fidonet addresses I have
used the form #:#/#.#@<Fido>, try <name>@p#.f#.n#.z#.FidoNet.Org
(note address numbers in reverse order).
Name Name of the individual.
Call Call letters of the individual. Old and alternate calls '/' separated.
Date Last update YY-M[-D] International format.
A trailing * denotes not searched in call book for verification yet, @
means not found in call book (1987, 1992 CAN or 1993 US). ? after means
recheck may be required (eg. Call does not match name).
#
This list has a life of it's own, so references to *my* list will be ignored.

802. Radio Amateurs on USENET List Jan 1994 Part 2 of 6

Newsgroup: rec.radio.amateur.misc
Date: 1994-01-28 12:33:26 UTC
From: mark@ve6mgs.ampr.ab.ca
Message-ID: <1994Jan28.2@ve6mgs.ampr.org>
Source record: 271780
Cross-posted to: rec.radio.amateur.misc,rec.radio.info,rec.answers,news.answers

```
Archive-name: radio/ham-radio/hams-on-usenet/part2
Last-modified: $Date: 94/33/28 05 33$
Version: $Revision: 1.03 $

I would be pleased to take any e-mail updates to this list, preferably at
hams-on-usenet@ve6mgs.ampr.ab.ca. I have split this list into six parts. This
Second part contains US call districts 1 and 2.

Ciao, 73 de VE6MGS/Mark -sk-

# Network address to name or call letters lookup table maintained by
# Mark Salyzyn VE6MGS mark@ve6mgs.ampr.org
#
# Only posting entries less than 12 months old (three terms at most educational
# institutions) in the interest of bandwidth savings. The entire list is
# accessible at the ftp sites and via the email server in any case.
#
# Please send corrections/deletions/additions hams-on-usenet@ve6mgs.ampr.ab.ca
# (if unreachable, mark@ve6mgs.ampr.org or adec23.UUCP!mark is ok). Many
# additions and updates are generated by collecting postings to the
# rec.radio.amateur.* hierarchy, so keep that in mind when requesting
# additions. Australian Amateur Radio Operators may prefer to mail their updates
# to Dean Davidson <ddavidso@metz.une.edu.au>. Any person interested in handling
# regional versions of the list are invited to drop me a note, I am
# particularily interested in representatives of non-english speaking regions
# so as to increase the accessibility of the list.
#
# archived for ftp @ ftp.cs.buffalo.edu:hams_on_usenet courtesy of
# Devon Bowen KA2NRC <bowen@cs.buffalo.edu>
# also ftp @ grivel.une.edu.au:pub/ham-radio/aus.radio/lists/internet.hams
# courtesy of Dean Davidson <ddavidso@metz.une.edu.au> for Australian hams.
# Canadian and US call sign lookups courtesy of the QRZ HAM Radio CDROM and
# thus thank Fred Lloyd <flloyd@qrz.com> for his efforts.
#
# email `grep' server reqnet@ve6mgs.ampr.ab.ca in the body of the message put
# a `lookup string ...'. email response limited to 10K. if you want to specify
# a return address, add optional `return user@host.domain'. For example:
# Subject: Could be anything (sure!)
# return wabbit@it.was.a.tewibble.storm.edu
# lookup ka2nrc ve6tcp nm1d elmer

```

gain. I do not condone this list being used for generating junk mail or
other annoyances as this is not the purpose of the list. If you are in this
list and wish to keep your entry hidden, or that the name I have here be
changed (My middle name is Gregory and I am **** proud of it :-), I would
oblige.
#
Entries have this format (-> denotes separated by at least one tab):
Address (Name) -> Call -> Date
#
Address
Network address popularily used by individuals on the network. Although
the address that many news posters add may be incorrect, personal
e-mail contacts or updates are always placed first in the list of
duplicate calls. Removal of entries is by complaint only, so some
(mainly .EDU) may be invalid over time. For fidonet addresses I have
used the form #:#/#.#@<Fido>, try <name>@p#.f#.n#.z#.FidoNet.Org
(note address numbers in reverse order).
Name Name of the individual.
Call Call letters of the individual. Old and alternate calls '/' separated.
Date Last update YY-M[-D] International format.
A trailing * denotes not searched in call book for verification yet, @
means not found in call book (1987, 1992 CAN or 1993 US). ? after means
recheck may be required (eg. Call does not match name).
#
This list has a life of it's own, so references to *my* list will be ignored.
